(54) Title: AFFINITY SELECTION-BASED SCREENING OF HYDROPHOBIC PROTEINS

WO 02/057792 A2

(57) Abstract: The invention relates to methods based on affinity selection for the identification of ligands for hydrophobic proteins bound by amphiphile. The invention also provides hydrophobic proteins and methods of isolation of hydrophobic proteins that are suitable for ligand screening.

AFFINITY SELECTION-BASED SCREENING OF HYDROPHOBIC PROTEINS

5

BACKGROUND OF THE INVENTION

Field of the Invention

The invention relates to the fields of pharmacology and medicine. More specifically, the invention relates to the screening of hydrophobic proteins for the identification of 10 the respective ligand molecules with particular relevance to the development of novel medicines and medical diagnostics.

Summary of the Related Art

Hydrophobic proteins (HPs) present a unique problem for 15 the pharmaceutical industry in the development of agonists and antagonists of hydrophobic protein function. The difficulty arises from the fact that HPs are not easily purified and are difficult to work with in isolated form (e.g., solubility difficulties, etc.). Given the nonpolar 20 nature of hydrophobic proteins, they may be found, *inter alia*, associated with the lipid bi-layer of a cell and the organelles therein. By way of nonlimiting example, the term hydrophobic protein includes membrane proteins, integral membrane proteins, transmembrane proteins, monotopic 25 membrane proteins, polytopic membrane proteins, pump proteins (a subclass of enzymes), channel proteins, receptor kinase proteins, G protein-coupled receptor proteins, membrane-associated enzymes, transporter proteins, etc. Frequently, these proteins play an important role in intra- 30 and intercellular signaling and the general relation of a cell to its environment, e.g., solute movement, etc. Thus, hydrophobic proteins are important targets for drug development.

The human genome project will provide an enormous 35 amount of information about the structure and function of

hydrophilic and hydrophobic proteins encoded therein. For example, it is estimated that 1,700-5,000 G protein-coupled receptor proteins (GPCRs) will be discovered in the human genome (Marchese, A., et al. (1999) *Trends Pharmacol. Sci.* 20:370; Henikoff, S., et al. (1997) *Science* 278:609). However, given the lack of suitable screening methodologies for the identification of ligands that bind hydrophobic proteins, hundreds of the GPCRs identified by the human genome project will be classified as orphan receptors, 10 having no known ligand to advance their study. GPCRs are so important to the medical sciences that a separate database has been established to provide information on sequence data, mutant data, and ligand binding data, for example (Horn, F. et al. (1998) *Nucleic Acids Research* 26: 227-281). 15 Thus, there is a need in the art for the development of screening methodologies, particularly high throughput methodologies, for HP ligand identification.

In the prior art, there is no record of affinity selection-based screening of HPs. Instead, these targets 20 are screened in functional assays or ligand displacement assays. All ligand displacement assays and most functional assays used to screen HPs are either performed in cell-based formats (for example, see Jayawickreme, C.K. and Kost, T.A., (1997) *Current Opinion in Biotechnology* 8: 629-634 and Chen, 25 G., et al. (1999) *Molecular Pharmacology* 57: 125-124, which both disclose cell-based melanophore assays; Mere, L. et al. (1999) *Drug Discovery Today* 4:363-369, which discloses a cell-based fluorescence resonance energy transfer (FRET)-based assay; and Schaeffer, M.T., et al. (1999) *J. Receptor 30 & Signal Transduction Research* 19: 927-938, which discloses a cell-based aequorin assay) or use impure cell membrane preparations (for example, see Cromlish et al. US Patent No. 5,543,297, which discloses a microsome-based assay; and see Labella, F.S., et al. *Fed. Proc.* (1985) 44: 2806-2811, which 35 discloses a radioligand displacement assay using membrane

preparations.). These screening formats are poorly defined at the molecular level and suffer from low signal-to-noise ratios, false positives, and variability in the degree to which the target protein is expressed and wide variability 5 in gene expression parameters.

More rarely, HP targets are purified for screening. For example, COX-2 purified in a detergent-solubilized form can be screened by monitoring its enzymatic activity in a homogeneous solution phase assay wherein small molecule 10 inhibitors of enzymatic activity can be identified as drug leads (see Song, Y., et al. (1999) *J. Med. Chem.* **42**: 1151-1160 and Barnett, J., et al. (1994) *Biochimica et Biophysica Acta* **1209**: 130-139 . Alternatively, the HP may be bound to a carrier for screening purposes (see Sklar, L.A. et al. 15 (2000) *Biotechniques* **28**: 976-985; Bieri, C. et al. (1999) *Nature Biotechnology* **17**: 1105-1108; and Schmid, E.L., et al. (1998) *Anal. Chem.* **70**: 1331-1338). However, screening 20 assays that use functional readouts presume foreknowledge of the target's function. Also, as in the case of many imaging agents used for medical diagnosis, many desired protein ligands do not modulate an assayable function and only bind 25 to the protein.

Affinity selection to identify ligands to water-soluble proteins is known in the art. For example, International 25 Publication No. WO 99/35109 by Nash et al. describes a method for producing mass-coded combinatorial libraries, which are useful in combination with affinity selection and the identification of the bound ligand by mass spectroscopy. International Patent Application No. WO 97/01755 by Jindal 30 et al. describes the affinity selection of ligands bound to a target molecule combined with the subsequent isolation of the ligand molecule by multidimensional chromatographic methodology. And U.S. Patent No. 6,020,141 by Pantoliano et al. describes a method of affinity selection combined with 35 ligand identification by thermal shift assay.

Regardless of these advances with affinity ligand selection and ligand identification, there still remains a fundamental challenge to apply affinity selection to non-water-soluble HP targets because of the hindering presence 5 of excess amphiphile, which is required to maintain the pure HP in a biologically active conformation.

It is important to recognize the difference between a preparation of a water-soluble protein and a preparation of pure HP. The HP is solvated through hydrophobic 10 interactions between the hydrophobic parts of the HP and the hydrophobic moiety of the amphiphile. In a preparation of pure water-soluble protein, all buffer components are hydrophilic and solvate the protein either through hydration or by participating in electrostatic or ionic bonds. By 15 contrast the amphiphile in preparations of pure HP imparts a colloidal characteristic to the solution. Typically, HPs are purified in 100 to 10,000-fold molar excess of detergent. These amphiphilic detergent molecules interact with both the HP and the drug molecules being screened. In 20 addition, amphiphiles form macromolecular assemblies, like micelles or liposomes, that are just as large as most proteins. These macromolecular assemblies impart a colloidal characteristic to solutions of amphiphile-solublized HP, further distinguishing HP's from soluble 25 proteins.

Compared to soluble protein targets, the extra complexity of HP-amphiphile preparations hampers the detection of the bound ligands, lowers screening 30 sensitivity, and yields high rate of false positive. In a typical preparation, the molecular entities responsible for these complications could be identified as: HP-amphiphile complexes (20 μ M, HP:amphiphile::1:5-250; MW=50-500 kD), micelles (5000 μ M MW=60 kD), monomeric amphiphile (500 μ M; MW=1200). In an analogous water-soluble protein 35 preparation, one would have only 20 μ M protein. In both

cases buffers (e.g. tris or Na-phosphate) and salt (e.g. NaCl or KCl) would also be present. For preparations of HP proteins, the presence of the various amphiphile entities presents extra complexity not found in soluble protein 5 preparations.

Thus, there is a continuing need in the art for an affinity selection-based HP screening method that can operate in the presence of an amphiphile without regard to the specific biological function of the HP target.

10

BRIEF SUMMARY OF THE INVENTION

The invention provides an affinity selection-based HP screening method that can operate in the presence of an amphiphile without regard to the specific biological 15 function of the HP target.

The present invention solves problems associated with affinity selection of HP ligands by enabling detection of the specific binding of a small drug-like molecules to an HP in the presence of an amphiphile. In addition, the present 20 invention also provides novel methods and compositions of matter for the production of purified HPs useful for screening purposes. These discoveries have been exploited to provide the present invention, which includes compositions and methods.

25 In a first aspect, the invention provides a method for identifying a ligand for a hydrophobic protein, the method comprising (a) selecting a ligand molecule by affinity selection by exposing a hydrophobic target protein bound by an amphiphile to a multiplicity of molecules to promote the 30 formation of at least one complex between the hydrophobic target protein and the ligand molecule; (b) separating the complex from the unbound molecules; and (c) identifying the ligand molecule.

35 In certain embodiments of the first aspect, exposure of the hydrophobic target protein to a multiplicity of

5 molecules occurs under homogeneous solution phase conditions. In certain embodiments of the first aspect, exposure of the hydrophobic target protein to a multiplicity of molecules occurs under heterogeneous solution phase conditions. In certain embodiments of the first aspect, selection of the ligand molecule is done using multi-dimensional chromatography.

10 In certain embodiments of the first aspect, the hydrophobic target protein is selected from the group consisting of a membrane protein, an integral membrane protein, a transmembrane protein, a monotopic membrane protein, a polytopic membrane protein, a pump protein, a channel protein, a receptor kinase protein, a G protein-coupled receptor protein, a membrane-associated enzyme, and 15 a transporter protein.

20 In certain embodiments of the first aspect, the multiplicity of molecules is a mass coded library of molecules. In certain embodiments of the first aspect, the multiplicity of molecules is a library of molecules that is not mass coded. In certain embodiments of the first aspect, the amphiphile is selected from the group consisting of (a) a polar lipid, (b) an amphiphilic macromolecular polymer, (c) a surfactant or detergent, and (d) an amphiphilic polypeptide. In certain embodiments of the first aspect, 25 ligand molecule identification is done by mass spectral analysis. In certain embodiments of the first aspect, the ligand molecule is deconvoluted by mass spectral analysis. In certain embodiments of the first aspect, separation of the complex from the unbound molecules is accomplished with 30 solid phase chromatography media.

35 In certain embodiments of the first aspect, the hydrophobic target protein comprises (a) at least one transmembrane domain sequence, (b) at least two tag sequences useful for affinity purification, and (c) a hydrophobic protein (HP) sequence. In certain embodiments

thereof, the hydrophobic protein sequence is selected from the group consisting of (a) a membrane protein, (b) an integral membrane protein, (c) a transmembrane protein, (d) a monotopic membrane protein, (e) a polytopic membrane 5 protein, (f) a pump protein, (g) a channel protein, (h) a receptor kinase protein, (i) a G protein-coupled receptor protein, (j) a membrane-associated enzyme, and (k) a transporter protein. In certain embodiments thereof, the tag sequences comprise epitope tag sequences selected from 10 the group consisting of (a) a FLAG tag (NH2-DYKDDDDK-COOH) (SEQ ID NO:1), (b) an EE tag (NH2-EEEEYMPME-COOH) (SEQ ID NO:2), (c) a hemagglutinin tag (NH2-YPYDVPDYA-COOH) (SEQ ID NO:3), (d) a myc tag (NH2-KHKLEQLRNSGA-COOH) (SEQ ID NO:4), (e) an HSV tag (NH2-QPELAPEDPED-COOH) (SEQ ID NO:5) and (f) 15 a rhodopsin tag (NH2-

MNGTEGPNFYVPFSNKTGVVRSPEAPQYYLAEPWQFSM-COOH) (SEQ ID NO:6).

In certain embodiments of the first aspect, the hydrophobic target protein comprises a sequence with an amino terminus to carboxy terminus order selected from the 20 group consisting of (a) Tag1-Tag2-HP, (b) Tag1-HP-Tag2, and (c) HP-Tag1-Tag2. In certain embodiments of thereof, the invention provides a method wherein the hydrophobic target protein is selected from the group consisting of (a) Myc tag-EE tag-Human m2 muscarinic acetylcholine receptor 25 (mAChR) (SEQ ID NO:7), (b) Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:8), (c) Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:9), (d) Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:10), and (e) Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:11). In certain embodiments 30 thereof, the invention provides a method wherein the hydrophobic target protein further comprises a heterologous signal sequence (SS) at the amino terminus. In certain embodiments thereof, the heterologous signal sequence is selected from the group consisting of (a) the Mellitin 35 signal sequence of NH2-KFLVNVALVFMVVYISYIYA-COOH (SEQ ID

NO:12), (b) the GP signal sequence of NH2-VRTAVLILLLVRFSEP-COOH (SEQ ID NO:13), (c) the Hemagglutinin signal sequence of NH2-KTIIIALSYIFCLVFA-COOH (SEQ ID NO:14), (d) the rhodopsin tag 1 signal sequence of NH2-
5 MNGTEGPNFYVPFSNKTGVVRSPEAPQYYLAEP-COOH (SEQ ID NO:15), and (e) the rhodopsin tag ID4 signal sequence of NH2-GKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:16). In certain embodiments thereof the tag sequences further comprise a hexahistidine sequence (SEQ ID NO:17) and a decahistidine
10 sequence (SEQ ID NO:18). In yet certain embodiments thereof the hydrophobic target protein is selected from the group consisting of (a) GP67 SS-Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:19), (b) Mellitin SS-Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:20), (c) Hemagglutinin SS-Human
15 Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:21), (d) Mellitin SS-Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:22), and (e) Hemagglutinin SS-Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:23).

20 In a second aspect, the invention provides a method of isolating a hydrophobic protein, the method comprising (a) purifying the hydrophobic protein by sucrose gradient ultracentrifugation, (b) purifying the hydrophobic protein by antibody affinity purification, and (c) purifying the hydrophobic protein by immobilized metal affinity
25 chromatography.

20 In certain embodiments of the second aspect, the hydrophobic protein comprises (a) at least one transmembrane domain sequence, (b) at least two tag sequences useful for affinity selection, and (c) a hydrophobic protein (HP)
30 sequence. In certain embodiments thereof, the hydrophobic protein sequence is selected from the group consisting of (a) a membrane protein, (b) an integral membrane protein, (c) a transmembrane protein, (d) a monotopic membrane protein, (e) a polytopic membrane protein, (f) a pump
35 protein, (g) a channel protein, (h) a receptor kinase

protein, (i) a G protein-coupled receptor protein, (j) a membrane-associated enzyme, and (k) a transporter protein. In certain embodiments of the second aspect, the tag sequences of the hydrophobic protein comprise epitope tag sequences selected from the group consisting of (a) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:1), (b) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:2), (c) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID NO:3), (d) a myc tag (NH₂-KHKLEQLRNSGA-COOH) (SEQ ID NO:4), (e) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:5) and (f) a rhodopsin tag (NH₂ MNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEPWQFSM-COOH) (SEQ ID NO:6). In certain embodiments of the second aspect, the hydrophobic protein comprises a sequence with an amino terminus to carboxy terminus order selected from the group consisting of (a) Tag1-Tag2-HP, (b) Tag1-HP-Tag2, and (c) HP-Tag1-Tag2.

In certain embodiments of the second aspect, the hydrophobic protein is selected from the group consisting of (a) Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:7), (b) Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:8), (c) Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:9), (d) Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:10), and (e) Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:11). In embodiments thereof, the hydrophobic protein further comprises a heterologous signal sequence (SS) at the amino terminus. In certain embodiments thereof, the heterologous signal sequence is selected from the group consisting of (a) the Mellitin signal sequence of NH₂-KFLVNVALVFMVVYISYIYA-COOH (SEQ ID NO:12), (b) the GP signal sequence of NH₂-VRTAVLILLLVRFSEP-COOH (SEQ ID NO:13), (c) the Hemagglutinin signal sequence of NH₂-KTIIIALSYIFCLVFA-COOH (SEQ ID NO:14), (d) the rhodopsin tag 1 signal sequence of NH₂-MNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID NO:15), and (e) the rhodopsin tag ID4 signal sequence of NH₂-GKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:16). In certain

embodiments of the second aspect, the tag sequences of the hydrophobic protein further comprise a hexahistidine sequence (SEQ ID NO:17) and a decahistidine sequence (SEQ ID NO:18).

5 In certain embodiments thereof, the hydrophobic target protein is selected from the group consisting of (a) GP67 SS-Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:19), (b) Mellitin SS-Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:20), (c) Hemagglutinin SS-Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:21), (d) Mellitin SS-Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:22), and (e) Hemagglutinin SS-Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:23).

10 In a third aspect, the invention provides an isolated nucleic acid molecule suitable for hydrophobic protein expression, comprising (a) a vector polynucleotide sequence for protein expression in a eukaryotic cell, and (b) a polynucleotide sequence encoding an engineered hydrophobic protein comprising the following elements (i) an N-terminal 15 methionine residue, (ii) a heterologous signal sequence (SS), (iii) at least one transmembrane domain sequence, (iv) at least two tag sequences useful for affinity purification, and (v) a hydrophobic protein (HP) sequence. In certain 20 embodiments thereof, the N-terminal methionine sequence and the heterologous signal sequence are selected from the group 25 consisting of (a) MKFLVNVALVFMVVYISYIYA (SEQ ID NO:24), (b) MVRTAVLILLLVRFSEP (SEQ ID NO:25), (c) MKTIIIALSYIFCLVFA (SEQ ID NO:26), (d) MMNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEV-COOH (SEQ ID NO:27), and (e) MGKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:28).

30 In certain embodiments thereof, the tag sequences comprise epitope tag sequences selected from the group consisting of (a) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:1), (b) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:2), (c) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID NO:3), (d)

a myc tag (NH₂-KHKLEQLRNNSGA-COOH) (SEQ ID NO:4), and (e) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:5).

In certain embodiments of the third aspect, the elements of the engineered hydrophobic protein are arrayed 5 from an amino to carboxy terminus order selected from the group consisting of (a) SS-Tag1-Tag2-HP, (b) SS-Tag1-HP-Tag2, and (c) SS-HP-Tag1-Tag2. In certain embodiments thereof, the engineered hydrophobic protein is selected from the group consisting of (a) GP67 SS-Myc tag-EE tag-Human m2 10 mAChR (SEQ ID NO:19), (b) Mellitin SS-Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:20), and (c) Hemagglutinin SS-Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:21). In a further embodiment of the third aspect, the tag sequences further comprise a hexahistidine 15 sequence (SEQ ID NO:17) and a decahistidine sequence (SEQ ID NO:18).

In a fourth aspect, the invention provides a method for identifying a ligand for a hydrophobic protein, the method comprising (a) selecting a hydrophobic target protein from 20 the group consisting of (i) a membrane protein, (ii) an integral membrane protein, (iii) a transmembrane protein, (iv) a monotopic membrane protein, (v) a polytopic membrane protein, (vi) a pump protein, (vii) a channel protein, (viii) a receptor kinase protein, (ix) a G protein-coupled 25 receptor protein, (x) a membrane-associated enzyme, and (xi) a transporter protein, wherein the hydrophobic protein is bound by amphiphile selected from the group consisting of (i) a polar lipid, (ii) an amphiphilic macromolecular polymer, (iii) a surfactant or detergent, and (iv) an amphiphilic polypeptide; (b) selecting a ligand 30 molecule using multi-dimensional chromatography by affinity selection by exposing under homogenous or heterogeneous solution phase conditions the hydrophobic target protein bound by an amphiphile to a multiplicity of molecules from a 35 mass-coded library to promote the formation of at least one

complex between the hydrophobic target protein and the ligand molecule, (c) separating the complex from the unbound molecules, and (d) identifying the ligand molecule by mass spectral analysis.

5 In a fifth aspect, the invention provides a method for identifying a ligand for a hydrophobic protein, the method comprising (a) selecting a hydrophobic target protein from the group consisting of (i) a membrane protein, (ii) an integral membrane protein, (iii) a transmembrane protein,
10 (iv) a monotopic membrane protein, (v) a polytopic membrane protein, (vii) a pump protein, (viii) a channel protein, (ix) a receptor kinase protein, (x) a G protein-coupled receptor protein, (xi) a membrane-associated enzyme, and (xii) a transporter protein, wherein the hydrophobic
15 protein is bound by amphiphile selected from the group consisting of (i) a polar lipid, (ii) an amphiphilic macromolecular polymer, (iii) a surfactant or detergent, and (iv) an amphiphilic polypeptide; (b) selecting a ligand molecule using multi-dimensional chromatography by affinity
20 selection by exposing under homogenous or heterogeneous solution phase conditions the hydrophobic target protein bound by an amphiphile to a multiplicity of molecules from a library that is not mass-coded to promote the formation of at least one complex between the hydrophobic target protein
25 and the ligand molecule, (c) separating the complex from the unbound molecules, and (d) identifying the ligand molecule by mass spectral analysis.

In a sixth aspect, the invention provides a method of isolating a hydrophobic protein, the method comprising: (a) 30 selecting a hydrophobic protein comprising: (i) at least one transmembrane domain sequence, (ii) at least two tag sequences useful for affinity selection selected from the group consisting of: (A) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:29), (B) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:30), (C) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID

NO:31), (D) a myc tag (NH2-KHKLEQLRNSGA-COOH) (SEQ ID NO:32), and (E) an HSV tag (NH2-QPELAPEDPED-COOH) (SEQ ID NO:33); (iii) a hydrophobic protein (HP) sequence selected from the group consisting of: (A) a membrane protein, (B) an 5 integral membrane protein, (C) a transmembrane protein, (D) a monotopic membrane protein, (E) a polytopic membrane protein, (F) a pump protein, (G) a channel protein, (H) a receptor kinase protein, (I) a G protein-coupled receptor protein, (J) a membrane-associated enzyme, and (K) a 10 transporter protein; (b) purifying the hydrophobic protein by sucrose gradient ultracentrifugation; (c) purifying the hydrophobic protein by antibody affinity purification; and (d) purifying the hydrophobic protein by immobilized metal 15 affinity chromatography.

15 In a seventh aspect, the invention provides, an isolated nucleic acid molecule suitable for hydrophobic protein expression, comprising: (a) a vector polynucleotide sequence for protein expression in a eukaryotic cell, and (b) a polynucleotide sequence encoding an engineered 20 hydrophobic protein comprising the following elements (i) an N-terminal methionine residue, (ii) a heterologous signal sequence (SS), wherein the N-terminal methionine sequence and the heterologous signal sequence are selected from the group consisting of (1) MKFLVNVALVFMVVYISYIYA (SEQ ID NO:24), (2) MVRTAVLILLLVRFSEP (SEQ ID NO:25), (3) MKTIIIALSYIFCLVFA (SEQ ID NO:26), (4) MMNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID NO:27) and (5) MGKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:28); (iii) at least one transmembrane domain sequence, (iv) at least two tag 25 sequences useful for affinity selection selected from the group consisting of (1) a FLAG tag (NH2-DYKDDDDK-COOH) (SEQ ID NO:1), (2) an EE tag (NH2-EEEEYMPME-COOH) (SEQ ID NO:2), (3) a hemagglutinin tag (NH2-YPYDVPDYA-COOH) (SEQ ID NO:3), (4) a myc tag (NH2-KHKLEQLRNSGA-COOH) (SEQ ID NO:4), and (5) 30 an HSV tag (NH2-QPELAPEDPED-COOH) (SEQ ID NO:5), and (v) a 35

hydrophobic protein (HP) sequence selected from the group consisting of (1) a membrane protein, (2) an integral membrane protein, (3) a transmembrane protein, (4) a monotopic membrane protein, (5) a polytopic membrane 5 protein, (6) a pump protein, (7) a channel protein, (8) a receptor kinase protein, (9) a G protein-coupled receptor protein, (10) a membrane-associated enzyme, and (11) a transporter protein.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 presents the amino acid sequence of the HP protein GP67 SS-Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:19).

15

Figure 2 presents the amino acid sequence of the HP protein Mellitin-Flag Tag-Human Beta 2 Adrenergic Receptor-EE (SEQ ID NO:20).

20

Figure 3 presents the amino acid sequence of the HP protein Hemagglutinin SS-Human Neurokinin 3 Receptor-HSV-Myc (SEQ ID NO:21).

Figure 4 presents the amino acid sequence of the HP protein Mellitin-Flag Tag-Human m1 mAChR-EE (SEQ ID NO:22).

25

Figure 5 presents the amino acid sequence of the HP protein Hemagglutinin SS-Rat m3 mAChR-HSV-OctaHis (SEQ ID NO:23).

30

Figure 6 presents SEC chromatograms represented by a screenshot from a computer interface developed to monitor the performance of the ALIS screening system. Relative absorbance at 230 nm is plotted on the vertical axis versus elution time following sample injection after injection onto 35 the SEC column. The view compiles separation profiles for

the analysis of six different binding reaction mixtures. In each case the mixture is composed of 25 μ M each indomethacin and meclofenamate, 10 μ M COX-1, and 1 μ M each for approximately 2500 individual screening compounds. The 5 peaks eluting between 12-15 seconds correspond to the COX-1 containing SEC fractions that are sent to the mass spectrometer for analysis. The peaks eluting after 17 seconds corresponds to unbound library members.

10 Figure 7 presents mass spectral analysis showing the estimated recovery of two known COX-1 ligands (NSAID LM, composed of indomethacin and meclofenamate) extracted from test libraries as described in Fig. 1. Different COX-1 preparations from different days (10/15 and 10/18) bind the 15 known ligands in the absence and presence of competing libraries (NGL-15-A-137, NGL-10-A-41, NGL-116-A-470, NGM-51, NGM-108, NGM-177). By comparison to standard curves, the mass spectral analysis permits estimation of the pmol of each ligand recovered. Estimates were performed in 20 triplicate for both indomethacin and meclofenamate.

25 Figure 8 presents the structure of an example COX-1 ligand identified by ALIS. This compound, termed NGL-177-A-1128-A-2a, is one example of a compound identified as a COX-1 ligand by ALIS screening.

30 Figure 9 presents a bar graph demonstrating competition with meclofenamate for COX-1 binding. Selected COX-1 hit compounds, each present at approximately 1 μ M and identified by ten character names prefixed with NGL-x, were 35 individually tested to determine whether they compete with 25 μ M meclofenamate for binding to COX-1. The mass spectral response corresponding to the mass of either meclofenamate or the test ligand was quantified. For test ligands that are competitive with meclofenamate for COX-1 binding, the

"ligand + competitor" response will be lower than the "ligand - competitor" response. Also, the meclofenamate response will be lower for that "ligand + competitor" trial than in the "COX1 + 25 μ M Meclofenamate trial." For 5 example, the test compound represented by NGL-169-A-1151-A-4 is competitive with meclofenamate while the test compound represented by NGL-175-A-1127-A-1 is not significantly competitive.

10 Figure 10 presents a bar graph demonstrating the extent of M2R1 ligand recovery quantified by the signal strength of the mass spectral analysis in accordance with the ALIS procedure. The x-axis is in relative units of mass spectrometric signal response for the respective masses of 15 pirenzepine, QNB, and atropine.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The invention relates to the fields of pharmacology and medicine. More specifically, the invention relates to the 20 screening of hydrophobic proteins for the identification of the respective ligand molecules with particular relevance to the development of novel medicines and medical diagnostics.

The patent and scientific literature cited herein establishes the knowledge that is available to those with 25 skill in the art. The issued U.S. patents, allowed applications, published foreign applications, and references cited herein are hereby incorporated by reference. Any conflicts between these sources and the present specification shall be resolved in favor of the latter.

30 The invention provides an affinity selection-based HP screening method that can operate in the presence of an amphiphile without regard to the specific biological function of the HP target.

Aspects of the invention utilize techniques and methods 35 common to the fields of molecular biology, cell biology and

immunology. Useful laboratory references for these types of methodologies are readily available to those skilled in the art. See, for example, Molecular Cloning, A Laboratory Manual, 2nd. edition, edited by Sambrook, J., Fritsch, B. F. and Maniatis, T., (1989), Cold Spring Harbor Laboratory Press; Current Protocols In Molecular Biology and Current Protocols in Immunology, Wiley Interscience, New York; Harlow & Lane, Antibodies: A Laboratory Manual, Cold Spring Harbor Press, Cold Spring Harbor, N.Y. (1988).

The invention herein relates to the preparation and purification of hydrophobic proteins and to methods for the identification of ligands that bind specifically to hydrophobic proteins. As used herein, the term "hydrophobic protein" refers to any purified protein that is prepared with amphiphile. Alternatively, the term may also refer to any protein for which, when purified to greater than 1% purity or purified to greater than 10% purity or purified to greater than 25% purity or purified to greater than 50% purity, either requires or benefits from the presence of an amphiphile for functional assays, to enhance stability (shelf-life or ability to withstand freeze-thaw cycles), or to retain conformational integrity as observed by common laboratory techniques including enzymatic analysis, ligand binding assays, circular dichroism, hydrodynamic assessments of mean size, shape, or density, interaction with conformation-specific antibodies. In a preferred embodiment the hydrophobic protein of the invention is a mammalian hydrophobic protein. In a particularly preferred embodiment, the hydrophobic protein of the invention is a human hydrophobic protein.

The term "hydrophobic protein" is also meant to include proteins identified by bioinformatics-assisted means through the use of the following non-limiting examples of algorithms designed for the identification of hydrophobic proteins: (a) DAS - Prediction of transmembrane regions in prokaryotes

using the Dense Alignment Surface method (Stockholm University) M. Cserzo, E. Wallin, I. Simon, G. von Heijne and A. Elofsson: Prediction of transmembrane alpha-helices in prokaryotic membrane proteins: the Dense Alignment
5 Surface method; Prot. Eng. vol. 10, no. 6, 673-676, 1997; (b) HMMTOP - Prediction of transmembrane helices and topology of proteins (Hungarian Academy of Sciences) G.E Tusnády and I. Simon (1998) Principles Governing Amino Acid Composition of Integral Membrane Proteins: Applications to Topology
10 Prediction. J. Mol. Biol. 283, 489-506; (c) Hidden Markov Model Predictions ELL Sonnhammer, G. von Heijne, and A. Krogh: A hidden Markov model for predicting transmembrane helices in protein sequences. Proc. of the Sixth Intern Conf. on Intelligent Systems for Molecular Biology (ISMB98),
15 175-182, 1998; (D) TMAP - Transmembrane detection based on multiple sequence alignment (Karolinska Institut; Sweden) No reference available: see URL at <http://www.mbb.ki.se/tmap/>; and (e) TopPred 2 - Topology prediction of membrane proteins (Stockholm University). "Membrane Protein Structure
20 Prediction, Hydrophobicity Analysis and the Positive-inside Rule", Gunnar von Heijne, J. Mol. Biol. (1992) 225, 487-494 and M. Cserzo, E. Wallin, I. Simon, G. von Heijne and A. Elofsson: Prediction of transmembrane alpha-helices in prokaryotic membrane proteins: the Dense Alignment Surface
25 method; Prot. Eng. vol. 10, no. 6, 673-676, 1997.

For a comparison of these methods see "Prediction of transmembrane alpha-helices in prokaryotic membrane proteins: the dense alignment surface method", Miklos Cserzo, Erik Wallin, Istvan Simon, Gunnar von Heijne, and Arne Elofsson, to appear in Protein Engineering, vol. 10, no. 6, (1997).

For exemplary purposes only, non-limiting examples of hydrophobic proteins (as the term is used herein) are presented in Table 1. These proteins are listed in GenBank, as indicated by the locus designations from the National 5 Center for Biotechnology Information (NCBI).

As will be understood by those in the art, a method of identifying a ligand for a hydrophobic protein is synonymous with a method of screening for a ligand that binds a small molecule. Furthermore, as used herein, the term "screening" 5 refers to a procedure used to detect the interaction between polypeptide, for example a hydrophobic protein, and a small molecule; it is useful for discriminating between ligands that bind to proteins with a $K_d < 200\mu M$ from large ensembles of ligands that either do not bind to the protein or bind 10 only weakly with a $K_d > 200\mu M$.

The present invention utilizes mass spectrometry (MS) in the identification of hydrophobic protein ligands. The MS technique is only rarely performed to analyze samples containing hydrophobic proteins because these samples 15 contain detergent amphiphiles. Detergents suppress analyte ion formation, a critical phenomenon for MS, and so significantly hamper MS, that reports of successful MS analysis of hydrophobic proteins are few. Nevertheless, several labs have tried to perform MS analysis of purified 20 hydrophobic proteins by identifying methods to remove the detergent prior to MS analysis. All of these labs use matrix-assisted laser desorption ionization (MALDI) to present the protein sample to the detector.

However, all of the known methods for sample 25 preparation of hydrophobic proteins use organic solvents and/or acid to extract the detergent from the polypeptide prior to MS analysis. Such treatment denatures the polypeptide, a fact that precludes the binding of ligands to the analyte hydrophobic protein. For researchers interested 30 in using MS for the study of hydrophobic protein-ligand interactions, denaturing preparation methods are not suitable. Moreover, the preparation of a membrane protein for analysis by MALDI-MS is laborious compared to the method provided by the present invention.

By contrast, in certain preferred embodiments the present invention uses electrospray ionization (ESI) MS which permits the fluid handling of a membrane protein sample as it passes from the SEC separation to the MS 5 detector. As such, the MS analysis proceeds in less than 30 seconds after the sample is sent to the RPC column.

The reasons why detergents must be removed from protein samples prior to mass spectrometric analysis are well known, and are provided, e.g., in the following references: (a) 10 BioTechniques (1997) 22:244-250; J.PC. Vissers, J.-P Chervet K. Sanborn, and J.-P Salzmann; (b) Protein Science (1994) 3:1975-1983; R.R. Ogorzalek Loo, N. Dales and P.C. Andrews; (c) J. Mass. Spectrom. (1995) 30:1462-8. Rosinke B, Strupat, K, et al.; Methods Enzymol. (1996) 270:519-51; 15 Beavis, RC and Chait, BT; and Proc. Natl. Acad. Sci. USA (1990) 87:6873-7; Beavis, RC and Chait, BT.; Fearnley, I.M. et a.;, Biochem. Soc. Trans., (1996) 24:12-917.

In a first aspect, the invention provides a method for identifying a ligand for a hydrophobic protein, the method 20 comprising (a) selecting a ligand molecule by affinity selection by exposing a hydrophobic target protein bound by an amphiphile to a multiplicity of molecules to promote the formation of at least one complex between the hydrophobic target protein and the ligand molecule; (b) separating the 25 complex from the unbound molecules; and (c) identifying the ligand molecule.

The affinity screening methods of the invention are to be distinguished from functional selection methodologies. Functional selection methodologies involve ligand selection 30 based on criteria that identify some specific protein-ligand or protein-protein interaction as significant; such ligand selection depends on either an action assignable to the protein (e.g., chemical catalysis for enzymes) or identification of some interaction between the protein and

some other molecule (e.g., interaction between a protein and a known small molecule ligand in the case of non-enzymes). In summary, these screening methodologies are generally based on enzymatic or biofunctional assays or ligand 5 displacement assays.

Various embodiments of the method of the invention may utilize an automated ligand identification system (ALIS) for the discovery of novel drug leads. ALIS selects ligands based on the affinity of the compound for its target protein 10 and identifies the ligands by mass spectrometry (see International Patent Application WO 99/35109). The invention herein provides for the application of ALIS to amphiphile complexed HPs.

As used herein, the term "affinity selection" means a 15 ligand selection based on the affinity of one molecule for a selected protein target; such ligand selection is independent of the functional activity of the protein of interest other than for the fact the protein binds the small molecule.

As used herein, the term "amphiphile" is used to mean 20 any molecule generally with the properties of a detergent, phospholipid, or surfactant that enhances the water solubility of hydrophobic polypeptides; specifically any molecule known to assume an association colloid in aqueous 25 solution; non-limiting examples of such amphiphiles would include phospholipids and other polar lipids (exemplified by phosphatidylcholines, lysophospholipids, cholesterols, lecithins, ceramides, etc); amphiphilic macromolecular polymers (exemplified by the work of Christophe Tribet and 30 Jean-Luc Popot (Tribet, C. et al. J.L. Natl. Acad. Sci. USA (1996) 93:15047-50); surfactants including alkyl saccharides, alkyl thioglycosides, alkyl dimethylamine oxides, bile acid derivatives like cholate and the CHAPS series, FOS-CHOLINE™ series, CYMAL™ or CYGLU™ series, 35 glucamides, and alkyl polyoxyethylenes, etc; or polypeptides

known to adopt amphipathic structures (exemplified by work of C.E. Schafmeister and R.M. Stroud (Schafmeister, C.E. et al., RM Science (1993) 262:734-8).

As used herein, the term "multiplicity of molecules" 5 refers to a plurality of molecules to be tested for the property of specific binding to a hydrophobic target protein. By the term "molecule" is meant, any compound in the size range of 150 to 5000 atomic mass units (amu). Such compounds may be generated by any means known in the art. 10 Particularly favored methods of generating the multiplicity of molecules is through the use of combinatorial chemistry. A "combinatorial library" refers to a plurality of molecules or compounds which are formed by combining, in every possible way for a given compound length, a set of chemical 15 or biochemical building blocks which may or may not be related in structure. Alternatively, the term can refer to a plurality of chemical or biochemical compounds which are formed by selectively combining a particular set of chemical building blocks. For example, twenty amino acids randomly 20 combined into hexameric peptides will produce no less than 64 million compounds. With the "combinatorial library" approach, as many different compounds as possible are made, and then candidate compounds are selected by screening them 25 for binding activity against the target molecule of interest, e.g., a hydrophobic protein.

There are now many methods well known in the art for the construction of combinatorial libraries. By way of non-limiting example, the following references provide methods for combinatorial library construction: U.S. Patent nos. 30 6,147,344; (WO 99/35109; 6,114,309; 6,025,371; 6,017,768; 5,962,337; 5,919,955; and 5,856,496, to name a few. As used herein, the term "multiplicity of molecules" may also refer to a natural plurality of molecules or compounds, obtained for example from body fluids, tissues or cells. These

samples may be manipulated, e.g., proteolytically digested, *in vitro* prior to their use in a ligand screening protocol.

In certain embodiments of the first aspect, exposure of the hydrophobic target protein to a multiplicity of 5 molecules occurs under homogeneous solution phase conditions. In certain embodiments of the first aspect, exposure of the hydrophobic target protein to a multiplicity of molecules occurs under heterogeneous solution phase conditions. In certain embodiments of the first aspect, 10 selection of the ligand molecule is done using multi-dimensional chromatography.

As used herein, the term "homogeneous solution phase" means a protein preparations whereby a protein is combined with (a) ligand(s) with the intent to facilitate possible 15 protein-ligand interactions; such preparations are found as sols in the temperature range of -40 to 60°C such that neither protein nor ligand are bound to a supporting element; these preparations would either pass through a semipermeable membrane with a size cut-off of 5.0 μM or 20 behave as though they a sedimentation coefficient of less than 500 Svedbergs or both; examples of such preparations would include combinations of ligand(s) with proteins that are solubilized in amphiphile, proteins incorporated into proteoliposomes, proteins incorporated into cell-derived 25 virus-like particles, etc.

As used herein, the term "heterogeneous solution phase" means a protein preparations whereby a protein is combined with (a) ligand(s) with the intent to facilitate possible protein-ligand interactions; such preparations are found as 30 mixtures in the temperature range of -40 to 60°C such that either the protein or the ligand is bound to a supporting element; these preparations would either fail to pass through a semipermeable membrane with a size cut-off of 5.0 μM or they would behave as though they have a sedimentation 35 coefficient of greater than 500 Svedbergs or both; examples

of such preparations would include combinations of ligand(s) with proteins that are presented on the surface of a bead/stationary element whereby the protein is attached to the bead/stationary element through either a covalent or 5 non-covalent linkage or a linkage dependent upon the self- association of amphiphiles or combinations of proteins with ligands that are fixed to a stationary phase.

As used herein, the term "multi-dimensional chromatography" means a procedure for processing a sample 10 involving more than one chromatographic method in tandem. Representative types of chromatographic methods include: (1) solid phase chromatography media: any of a variety of materials including small particles (<5 μ M), solid porous castings, filters, or semipermeable membranes that may 15 commonly be referred to as resins, gels, immobilized artificial membranes, stationary phase elements, or otherwise, and are used with the intent of providing stationary surfaces over which or through which solubilized analytes are passed or with which solubilized analytes 20 interact as in chromatographic or electrophoretic separations or fractionations; and (2) solution phase chromatography media: solutions or fluids suitable for use in electrophoretic separations or fractionations when used in combination with stationary phase chromatography media.

25 In certain embodiments of the first aspect, the hydrophobic target protein is selected from the group consisting of a membrane protein, an integral membrane protein, a transmembrane protein, a monotopic membrane protein, a polytopic membrane protein, a pump protein, a channel protein, a receptor kinase protein, a G protein-coupled receptor protein, a membrane-associated enzyme, and a transporter protein.

30 In certain embodiments of the first aspect, the multiplicity of molecules is a mass coded library of molecules. In certain embodiments of the first aspect, the

multiplicity of molecules is a library of molecules that is not mass coded.

As used herein, the term "mass-coded library" refers to a mass coded combinatorial library. The compounds of the 5 mass-coded combinatorial library are of the general formula $X(Y)_n$, wherein X is a scaffold, each Y is a peripheral moiety and n is an integer greater than 1, typically from 2 to about 6. The term "scaffold", as used herein, refers to a molecular fragment to which two or more peripheral 10 moieties are attached via a covalent bond. The scaffold is a molecular fragment which is common to each member of the mass-coded set of compounds. The term "peripheral moiety", as used herein, refers to a molecular fragment which is bonded to a scaffold. Each member of the set of mass-coded 15 compounds will include a combination of n peripheral moieties bonded to the scaffold and this set of compounds forms a mass-coded combinatorial library. More details of mass-coded libraries are provided in the patent application WO9935109A1, which is incorporated herein by reference.

As used herein, the phrase "a library of molecules that is not mass-coded" means any plurality of molecules or compounds that are not produced by a mass-coded combinatorial process. Thus, the term includes any and all other methods of producing a combinatorial library. In 25 addition, the term also includes compounds constructed by "Structure Based Drug Design" methodology, which seeks to design a drug based on the structure of the target protein, and natural libraries of compounds obtained from body fluids, tissues or cells.

In certain embodiments of the first aspect, the amphiphile is selected from the group consisting of (a) a polar lipid, (b) an amphiphilic macromolecular polymer, (c) a surfactant or detergent, and (d) an amphiphilic polypeptide. In certain embodiments of the first aspect, 30 ligand identification is done by mass spectral analysis. In 35

certain embodiments of the first aspect, the ligand molecule is deconvoluted by mass spectral analysis. In certain embodiments of the first aspect, separation of the complex from the unbound molecules is accomplished with solid phase 5 chromatography media.

By the term "ligand identification" as used herein is meant any process that can accurately specify the structural composition of a small molecule detected in a screen.

In certain embodiments of the first aspect, the 10 hydrophobic target protein comprises (a) at least one transmembrane domain sequence, (b) at least two tag sequences useful for affinity selection, and (c) a hydrophobic protein (HP) sequence. In certain embodiments thereof, the hydrophobic protein sequence is selected from 15 the group consisting of (a) a membrane protein, (b) an integral membrane protein, (c) a transmembrane protein, (d) a monotopic membrane protein, (e) a polytopic membrane protein, (f) a pump protein, (g) a channel protein, (h) a receptor kinase protein, (i) a G protein-coupled receptor 20 protein, (j) a membrane-associated enzyme, and (k) a transporter protein. In certain embodiments thereof, the tag sequences comprise epitope tag sequences selected from the group consisting of (a) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:1), (b) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID 25 NO:2), (c) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID NO:3), (d) a myc tag (NH₂-KHKLEQLRNSGA-COOH) (SEQ ID NO:4), (e) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:5) and (f) a rhodopsin tag (NH₂GTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEPWQFSM-COOH) (SEQ ID NO:6).

In certain embodiments of the first aspect, the 30 hydrophobic target protein comprises a sequence with an amino terminus to carboxy terminus order selected from the group consisting of (a) Tag1-Tag2-HP, (b) Tag1-HP-Tag2, and (c) HP-Tag1-Tag2. In certain embodiments of thereof, the 35 invention provides a method wherein the hydrophobic target

protein is selected from the group consisting of (a) Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:6), (b) Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:7), (c) Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:9), (d) 5 Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:10), and (e) Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:11). In certain embodiments thereof, the invention provides a method wherein the hydrophobic target protein further comprises a heterologous signal sequence (SS) at the amino terminus. In 10 certain embodiments thereof, the heterologous signal sequence is selected from the group consisting of (a) the Mellitin signal sequence of NH₂-KFLVNVALVFMVVYISYIYA-COOH (SEQ ID NO:12), (b) the GP signal sequence of NH₂-VRTAVLILLLVRFSEP-COOH (SEQ ID NO:13), (c) the Hemagglutinin 15 signal sequence of NH₂-KTIIIALSYIFCLVFA-COOH (SEQ ID NO:14), (d) the rhodopsin tag 1 signal sequence of NH₂-MNGTEGPNFYVPPFSNKTGVVRSPEAPQYYLAEP-COOH (SEQ ID NO:15), and (e) the rhodopsin tag ID4 signal sequence of NH₂-GKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:16). In certain 20 embodiments thereof the tag sequences further comprise a hexahistidine sequence (SEQ ID NO:17) and a decahistidine sequence (SEQ ID NO:18). In yet certain embodiments thereof the hydrophobic target protein is selected from the group consisting of (a) GP67 SS-Myc tag-EE tag-Human m2 mAChR (SEQ 25 ID NO:19), (b) Mellitin SS-Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:20), (c) Hemagglutinin SS-Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:21), (d) Mellitin SS-Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:22), and (e) Hemagglutinin SS-Rat m3 mAChR-HSV tag-OctaHis tag 30 (SEQ ID NO:23).

In a second aspect, the invention provides a method of isolating a hydrophobic protein, the method comprising (a) purifying the hydrophobic protein by sucrose gradient ultracentrifugation, (b) purifying the hydrophobic protein 35 by antibody affinity purification, and (c) purifying the

hydrophobic protein by immobilized metal affinity chromatography.

In certain embodiments of the second aspect, the hydrophobic protein comprises (a) at least one transmembrane

5 domain sequence, (b) at least two tag sequences useful for affinity selection, and (c) a hydrophobic protein (HP) sequence. In certain embodiments thereof, the hydrophobic protein sequence is selected from the group consisting of

10 (a) a membrane protein, (b) an integral membrane protein, (c) a transmembrane protein, (d) a monotopic membrane protein, (e) a polytopic membrane protein, (f) a pump protein, (g) a channel protein, (h) a receptor kinase protein, (i) a G protein-coupled receptor protein, (j) a membrane-associated enzyme, and (k) a transporter protein.

15 In certain embodiments of the second aspect, the tag sequences of the hydrophobic protein comprise epitope tag sequences selected from the group consisting of (a) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:1), (b) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:2), (c) a hemagglutinin tag (NH₂-

20 YPYDVPDYA-COOH) (SEQ ID NO:3), (d) a myc tag (NH₂-KHKLEQLRNSGA-COOH) (SEQ ID NO:4), (e) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:5) and (f) a rhodopsin tag (NH₂ MNGTEGPNFYVPPFSNKTGVVRSFEPQYYLAEPWQFSM-COOH) (SEQ ID NO:6).

25 In certain embodiments of the second aspect, the hydrophobic protein comprises a sequence with an amino terminus to carboxy terminus order selected from the group consisting of (a) Tag1-Tag2-HP, (b) Tag1-HP-Tag2, and (c) HP-Tag1-Tag2.

30 In certain embodiments of the second aspect, the hydrophobic protein is selected from the group consisting of

(a) Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:7), (b) Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:8), (c) Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:9), (d) Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:10),

35 and (e) Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:11). In

embodiments thereof, the hydrophobic protein further comprises a heterologous signal sequence (SS) at the amino terminus. In certain embodiments thereof, the heterologous signal sequence is selected from the group consisting of (a) 5 the Mellitin signal sequence of NH₂-KFLVNVALVFMVVYISIYACOOH (SEQ ID NO:12), (b) the GP signal sequence of NH₂-VRTAVLILLLVRFSEP-COOH (SEQ ID NO:13), (c) the Hemagglutinin signal sequence of NH₂-KTIIIALSYIFCLVFA-COOH (SEQ ID NO:14), (d) the rhodopsin tag 1 signal sequence of NH₂-10 MNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID NO:15), and (e) the rhodopsin tag ID4 signal sequence of NH₂-GKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:16). In certain 15 embodiments of the second aspect, the tag sequences of the hydrophobic protein further comprise a hexahistidine sequence (SEQ ID NO:17) and a decahistidine sequence (SEQ ID NO:18).

In certain embodiments of the second aspect, the hydrophobic target protein is selected from the group consisting of (a) GP67 SS-Myc tag-EE tag-Human m2 mAChR (SEQ 20 ID NO:19), (b) Mellitin SS-Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:20), (c) Hemagglutinin SS-Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:21), (d) Mellitin SS-Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:22), and (e) Hemagglutinin SS-Rat m3 mAChR-HSV tag-OctaHis tag 25 (SEQ ID NO:23).

In a third aspect, the invention provides an isolated nucleic acid molecule suitable for hydrophobic protein expression, comprising (a) a vector polynucleotide sequence 30 for protein expression in a eukaryotic cell, and (b) a polynucleotide sequence encoding an engineered hydrophobic protein comprising the following elements (i) an N-terminal methionine residue, (ii) a heterologous signal sequence (SS), (iii) at least one transmembrane domain sequence, (iv)

at least two tag sequences useful for affinity purification, and (v) a hydrophobic protein (HP) sequence.

By the phrase "a vector polynucleotide sequence for protein expression in a eukaryotic cell" is meant any 5 polynucleotide sequence comprising an origin of replication allowing replication in a eukaryotic cell, a selectable marker, e.g., antibiotic resistance marker, and a promoter sequence element to promote transcription of the structural gene, which may be viral, prokaryotic or eukaryotic in 10 origin. The origin of the vector polynucleotide sequence may be viral, prokaryotic or eukaryotic or a combination thereof. As will be understood in the art, the vector sequence while being designed for expression in a eukaryotic cell may optionally contain a prokaryotic origin of 15 replication. Non-limiting examples of suitable vector polynucleotide sequences include the following: baculovirus vectors such as pVL1392 (Pharmingen, San Diego, CA) and pBAC-1 (Novagen, Madison, WI) and mammalian expression vectors such as pcDNA 3.1 (Invitrogen, San Diego, CA) and 20 pTriEx-1 (Novagen, Madison, WI).

The appropriate DNA sequence may be inserted into the vector by a variety of procedures. In general, the DNA sequence is inserted into an appropriate restriction endonuclease site(s) by procedures known in the art. Such 25 procedures and others are deemed to be within the scope of those skilled in the art.

In certain embodiments, the present invention relates to host cells containing the above-described constructs. The host cell can be a higher eukaryotic cell, such as a 30 mammalian cell, or a lower eukaryotic cell, such as a yeast cell, or the host cell can be a prokaryotic cell, such as a bacterial cell. Introduction of the construct into the host cell can be effected by any means known in the art, including but not limited to transduction or transformation 35 or transfection or electroporation.

Examples of a suitable heterologous signal sequences (SS) include the honey bee mellitin SS (NH2-MKFLVNVALVFMVVYISYIYA-COOH) (SEQ ID NO:12) (Tessier D.C., (1991) *Gene* 98: 177), see also Invitrogen.com's pMelBac 5 product), the baculovirus gp67 SS (NH2-MVRTAVLILLLVRFSEP-COOH) (SEQ ID NO: 13) (Kretzschmar T., et al., (1996) *J. Immunol. Methods* 195: 93-101), the Influenza A virus hemagglutinin SS (NH2-MKTIIALSYIFCLVFA-COOH) (SEQ ID NO:14) (Verhoeven, M., (1980) *Nature* 286: 771-776), the rhodopsin 10 tag 1 SS (NH2-MNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH) (SEQ ID NO:15), or the rhodopsin tag ID4 SS (NH2-GKNPLGVRKTETSQVAPA-COOH) (SEQ ID NO:16). Generally, such suitable SSs will be less than 75 aa long. These signal 15 sequences may or may not be cleaved from the protein upon expression in animal cells. For example, the rhodopsin tag 1 is not cleaved off of the protein when presented by the cell to the plasma membrane, whereas rhodopsin tag ID4 signal sequence is cleaved off.

Non-limiting examples of a suitable epitope affinity 20 tags include FLAG (NH2-DYKDDDDK-COOH) (SEQ ID NO:29), "EE" (NH2-EEEEYMPME-COOH) (SEQ ID NO:30), hemagglutinin (NH2-YPYDVPDYA-COOH) (SEQ ID NO:31), myc (NH2-KHKLEQLRNSGA-COOH) (SEQ ID NO:32), or herpes simplex virus tag ("HSV"; NH2-QPELAPEDPED-COOH) (SEQ ID NO:33).

25 These design elements of the hydrophobic protein are arrayed from amino to carboxy terminus in one of the following permutations: (1) SS-Tag1-Tag2-HP; (2) SS-Tag1-HP-Tag2; (3) SS-HP-Tag1-Tag2.

In certain embodiments thereof, the N-terminal 30 methionine sequence and the heterologous signal sequence are selected from the group consisting of (a) MKFLVNVALVFMVVYISYIYA (SEQ ID NO:24), (b) MVRTAVLILLLVRFSEP (SEQ ID NO:25), (c) MKTIIALSYIFCLVFA (SEQ ID NO:26) (d) MMNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID NO:27) and 35 (e) MGKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:28).

In certain embodiments thereof, the tag sequences comprise epitope tag sequences selected from the group consisting of (a) a FLAG tag (NH2-DYKDDDDK-COOH) (SEQ ID NO:1), (b) an EE tag (NH2-EEEEYMPME-COOH) (SEQ ID NO:2), (c) 5 a hemagglutinin tag (NH2-YPYDVPDYA-COOH) (SEQ ID NO:3), (d) a myc tag (NH2-KHKLEQLRNSGA-COOH) (SEQ ID NO:4), (e) an HSV tag (NH2-QPELAPEDPED-COOH) (SEQ ID NO:5), and (f) a rhodopsin tag (NH2 MNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEPWQFSM-COOH) (SEQ ID NO:6).

10 In certain embodiments of the third aspect, the elements of the engineered hydrophobic protein are arrayed from an amino to carboxy terminus order selected from the group consisting of (a) SS-Tag1-Tag2-HP, (b) SS-Tag1-HP-Tag2, and (c) SS-HP-Tag1-Tag2. In embodiments thereof, the 15 engineered hydrophobic protein is selected from the group consisting of (a) GP67-Myc-EE-Human m2 mAChR (SEQ ID NO:19), (b) Mellitin-Flag Tag-Human Beta 2 Adrenergic Receptor-EE (SEQ ID NO:20), and (c) Hemagglutinin SS-Human Neurokinin 3 Receptor-HSV-Myc (SEQ ID NO:21). In a further 20 embodiment of the third aspect, the tag sequences further comprise a hexahistidine sequence (SEQ ID NO:17) and a decahistidine sequence (SEQ ID NO:18). In certain embodiments of the third aspect, the engineered hydrophobic protein is selected from the group consisting of (a) GP67- 25 Myc-EE-Human m2 mAChR (SEQ ID NO:19), (b) Mellitin-Flag Tag-Human m1 mAChR-EE (SEQ ID NO:20), and (c) Hemagglutinin SS-Rat m3 mAChR-HSV-OctaHis (SEQ ID NO:21).

30 The HP sequence of the isolated polynucleotide may be any polynucleotide encoding a protein that is isolated with amphiphile present. Alternatively, the term may also refer to any polynucleotide encoding a protein for which, when purified to greater than 1% purity or purified to greater than 10% purity or purified to greater than 25% purity or purified to greater than 50-99% purity, either requires or 35 benefits from the presence of an amphiphile for functional

assays, to enhance stability (shelf-life or ability to withstand freeze-thaw cycles), or to retain conformational integrity as observed by common laboratory techniques including ligand binding assays, circular dichroism, 5 hydrodynamic assessments of mean size, shape, or density, interaction with conformation-specific antibodies. In a preferred embodiment the hydrophobic protein of the invention is a mammalian hydrophobic protein. In a particularly preferred embodiment, the hydrophobic protein 10 of the invention is a human hydrophobic protein.

The HP sequence of the isolated polynucleotide may include polynucleotides encoding proteins that are identified by bioinformatics-assisted means through the use of the following non-limiting examples of algorithms 15 designed for the identification of hydrophobic proteins: (a) DAS - Prediction of transmembrane regions in prokaryotes using the Dense Alignment Surface method (Stockholm University) Cserzo, M. et al. (1997) *Prot. Eng.* **10**:673-676; (b) HMMTOP - Prediction of transmembrane helices and 20 topology of proteins (Hungarian Academy of Sciences) G.E. Tusnády and I. Simon (1998) *J. Mol. Biol.* **283**: 489-506; (c) Hidden Markov Model Predictions Sonnhammer, E.L.L. et al. (1998) A hidden Markov model for predicting transmembrane 25 helices in protein sequences. *Proc. of the Sixth Intern. Conf. on Intelligent Systems for Molecular Biology* (ISMB98), 175-182; (D) TMAP - Transmembrane detection based on multiple sequence alignment (Karolinska Institut; Sweden) No 30 reference available: see URL at <http://www.mbb.ki.se/tmap/>; and (e) TopPred 2 - Topology prediction of membrane proteins (Stockholm University). von Heijne, G. (1992) *J. Mol. Biol.* **225**:487-494 and Cserzo, M. et al. (1997) *Prot. Eng.* **10**:673-676.

35 Representative non-limiting examples of proteins that may be encoded by the HP polynucleotide of the invention are presented herein in Table 1.

All nucleic acid sequences and the respective amino acid sequences encoded thereby identified above by the appropriate GenBank accession numbers are herein incorporated by reference.

5 In a fourth aspect, the invention provides a method for identifying a ligand for a hydrophobic protein, the method comprising (a) selecting a hydrophobic target protein from the group consisting of (i) a membrane protein, (ii) an integral membrane protein, (iii) a transmembrane protein,

10 (iv) a monotopic membrane protein, (v) a polytopic membrane protein, (vii) a pump protein, (viii) a channel protein, (ix) a receptor kinase protein, (x) a G protein-coupled receptor protein, (xi) a membrane-associated enzyme, and (xii) a transporter protein, wherein the hydrophobic

15 protein is bound by amphiphile selected from the group consisting of (i) a polar lipid, (ii) an amphiphilic macromolecular polymer, (iii) a surfactant or detergent, and (iv) an amphiphilic polypeptide; (b) selecting a ligand molecule using multi-dimensional chromatography by affinity

20 selection by exposing under homogenous or heterogeneous solution phase conditions the hydrophobic target protein bound by an amphiphile to a multiplicity of molecules from a mass-coded library to promote the formation of at least one complex between the hydrophobic target protein and the

25 ligand molecule, (c) separating the complex from the unbound molecules, and (d) identifying the ligand molecule by mass spectral analysis.

In a fifth aspect, the invention provides a method for identifying a ligand for a hydrophobic protein, the method comprising (a) selecting a hydrophobic target protein from the group consisting of (i) a membrane protein, (ii) an integral membrane protein, (iii) a transmembrane protein, (iv) a monotopic membrane protein, (v) a polytopic membrane protein, (vii) a pump protein, (viii) a channel protein, (ix) a receptor kinase protein, (x) a G protein-coupled

receptor protein, Xii) a membrane-associated enzyme, and (Xiii) a transporter protein, wherein the hydrophobic protein is bound by amphiphile selected from the group consisting of (i) a polar lipid, (ii) an amphiphilic 5 macromolecular polymer, (iii) a surfactant or detergent, and (iv) an amphiphilic polypeptide; (b) selecting a ligand molecule using multi-dimensional chromatography by affinity selection by exposing under homogenous or heterogeneous solution phase conditions the hydrophobic target protein 10 bound by an amphiphile to a multiplicity of molecules from a library that is not mass-coded to promote the formation of at least one complex between the hydrophobic target protein and the ligand molecule, (c) separating the complex from the unbound molecules, and (d) identifying the ligand molecule 15 by mass spectral analysis.

In a sixth aspect, the invention provides a method of isolating a hydrophobic protein, the method comprising: (a) selecting a hydrophobic protein comprising: (i) at least one transmembrane domain sequence, (ii) at least two tag 20 sequences useful for affinity selection selected from the group consisting of: (A) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:29), (B) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:30), (C) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID NO:31), (D) a myc tag (NH₂-KHKLEQLRNSGA-COOH) (SEQ ID NO:32), and (E) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:33); (iii) a hydrophobic protein (HP) sequence selected 25 from the group consisting of: (A) a membrane protein, (B) an integral membrane protein, (C) a transmembrane protein, (D) a monotopic membrane protein, (E) a polytopic membrane protein, (F) a pump protein, (G) a channel protein, (H) a receptor kinase protein, (I) a G protein-coupled receptor protein, (J) a membrane-associated enzyme, and (K) a transporter protein; (b) purifying the hydrophobic protein 30 by sucrose gradient ultracentrifugation; (c) purifying the hydrophobic protein by antibody affinity purification; and 35

(d) purifying the hydrophobic protein by immobilized metal affinity chromatography.

In a seventh aspect, the invention provides, an isolated nucleic acid molecule suitable for hydrophobic protein expression, comprising: (a) a vector polynucleotide sequence for protein expression in a eukaryotic cell, and (b) a polynucleotide sequence encoding an engineered hydrophobic protein comprising the following elements (i) an N-terminal methionine residue, (ii) a heterologous signal sequence (SS), wherein the N-terminal methionine sequence and the heterologous signal sequence are selected from the group consisting of (1) MKFLVNVALVFMVVYISYIYA (SEQ ID NO:24), (2) MVRTAVLILLLVRFSEP (SEQ ID NO:25), (3) MKTIIIALSYIFCLVFA (SEQ ID NO:26), (4) MMNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID NO:27) and (5) MGKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:28); (iii) at least one transmembrane domain sequence, (iv) at least two tag sequences useful for affinity selection selected from the group consisting of (1) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:1), (2) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:2), (3) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID NO:3), (4) a myc tag (NH₂-KHKLEQLRNNSGA-COOH) (SEQ ID NO:4), and (5) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:5), and (v) a hydrophobic protein (HP) sequence selected from the group consisting of (1) a membrane protein, (2) an integral membrane protein, (3) a transmembrane protein, (4) a monotopic membrane protein, (5) a polytopic membrane protein, (6) a pump protein, (7) a channel protein, (8) a receptor kinase protein, (9) a G protein-coupled receptor protein, (10) a membrane-associated enzyme, and (11) a transporter protein.

The following examples are intended to further illustrate certain preferred preferred embodiments of the invention but are not meant to limit the scope of the invention in any way.

EXAMPLES

EXAMPLE 1: AFFINITY SELECTION OF COX-1 LIGANDS AND IDENTIFICATION BY ALIS

5 Purified ovine COX-1 (>95% by SDS-PAGE) from Cayman Chemical Company (Ann Arbor, MI) was prepared for screening by exchanging the detergent. To remove the detergent in which the protein was supplied, Tween-20, ion exchange chromatography was conducted. Approximately 6 mL of 0.27
10 mg/mL COX-1 in a buffer of 80 mM Tris-8.0, 0.09% Tween-20, 270 μ M DDC, and 240 μ M dodecyl- β -D-maltoside (D β M), which would provide a theoretical yield of 1.8 mg, was applied to a Poros HQ column with a buffer of 80 mM tris, pH 8.0, 240 μ M D β M (TBS-AGD). The column was developed with a linear
15 gradient from 0 to 0.5 M NaCl over 10 minutes with a flow rate of 5 mL/minute. The eluted protein fractions were identified by monitoring absorbance at 280 nm.

After this treatment, 18 mL of protein-containing material were pooled and concentrated in an Amicon-30
20 centricon according to the manufacturer's instructions (Millipore, Inc.; Bedford, MA). This yielded a concentration of approximately 1.8 mg/ml of COX-1 which was diluted to 1.3 mg/mL (20 μ M COX-1) for screening. It is estimated that the buffer in the final protein preparation
25 consisted of 2.4 mM D β M, 80 mM tris-8.0, about 50 mM NaCl. This COX-1 solution was promptly supplemented with 20 μ M hemin, and 300 μ M diethyldithiocarbamate (DDC) in accordance with the handling procedures used by Cayman Chemical company.

30 The COX-1 protein preparation was then used for sample preparation according to the appended sample preparation standard operating procedure (SOP, Table 2).

TABLE 2

Hydrophobic Protein Ligand Screening Procedure

Binding Mixture Components:

Final Protein Concentration	10 μ M	1.3 mg/mL (20 μ M) in 80 mM Tris/240 μ M DBM
Final library concentration	2.5 mM	5.5 mg/mL (~150 μ M) BlacB in 1X SEC
Final discrete ligand concentration	1 μ M	100mM in DMSO
Total volume (for single injection)	12 μ L	40 μ M in DMSO

Stock Reagents:

COX-1 Target Protein (2X, stored at -80 degrees)	1.3 mg/mL (20 μ M) in 80 mM Tris/240 μ M DBM
BlacB Control Protein (6X, stored at 4 degrees)	5.5 mg/mL (~150 μ M) BlacB in 1X SEC
Library (40X, stored at 80 degrees)	100mM in DMSO
Discrete Ligands (40X, stored at -80 degrees)	40 μ M in DMSO

41

SEC Premix:

SEC Buffer Stock (1M Tris 8.0)	400 μ L
Water	4.6 mL

Screening Procedure

1. Prepare SEC premix solution stock (80 mM Tris 8.0) and pre-equilibrate to 42 degrees Celsius
2. Check that stocks of libraries/ligands in DMSO are prepared and thawed to room temperature.
3. Add labels from database to each 250 μ L polypropylene autosampler vial
4. Add each library/ligand stock to a 500 μ L siliconized tube; store overnight at -80 degrees C

1 μ L of a 100 mM library stock or1 μ L of a 40 μ M discrete ligand stock

Continued

5. For protein controls w/o library/ligand, add DMSO instead of ligand/library stock 1 μ L DMSO
6. Thaw pre-aliquoted library/ligand stocks at room temp.; add warm premix to each library and mix immediately by pipetting and vortexing 19 μ L warm premix
7. Centrifuge at maximum RPM at room temp. for at least 10 minutes
8. Thaw target and control protein stocks on ice. Give to Analytical to exchange detergent to DBM (3 mL (500 Kunits) is enough for 50-75 samples)
9. Concentrate dilute COX-1 ~10x to 1.3-1.5 mg/ml with Centrifcon-30's. Determine protein conc. With Bio-Rad assay using BSA 1 mg/ml (Sigma P 0914) as reference standard. Assay centrifcon flowthrough for protein and correct [COX-1]
10. To COX-1, add 1 equivalent hemin (Sigma 3281, 3.3 μ M in DMSO) and DDC (Sigma D3056) to 300 μ M keep protein on ice until needed.
11. Carefully transfer clarified supernatants to new polypropylene autosampler vials
12. In cold room, aliquot target or control protein stock to vials 6 μ L supernatant containing libraries and mix well by pipetting

Incubate protein + library/ligand mixtures for 30 minutes at 4 degrees (no RT incubation)

Notes: For SEC chromatography: 50 mm GPC-Peptide columns run in 50 mM Tris pH 8.0, 150 mM NaCl, 2.5% DMSO

This sample prep SOP yields binding assays that combine COX-1 with mass-encoded combinatorial libraries made of approximately 2500 small drug-like molecules, each member at 5 a concentration of 1 μ M. The sample was incubated 30-minutes at 4°C. As the total volume was 12 μ L, the sample thus contained 240 pmol protein and 12 pmol of each library component. As a control test, an unrelated membrane protein, diacyl glycerol kinase (Calbiochem, Inc.; San 10 Diego, CA), was also prepared in the same buffer at 20 μ M and incubated with the same 2500-member library and treated similarly.

Then the mixtures were individually subjected to ALIS Analysis. If any ligand of suitably high affinity was bound 15 to the COX at the time its fraction was collected, the mass spectral analysis would identify its mass. By virtue of the mass-coding, the precise combination of building blocks and core molecule can be identified (see U.S. Patent No. 6,147,344). If the same compound failed to appear in the 20 diacyl glycerol kinase control experiment, the compound may then be identified as a specific ligand of the COX-1.

The mixtures were then individually subjected to modified ALIS analysis as follows. The large detergent-solubilized protein was separated from the small drug-like 25 molecules by size exclusion chromatography (SEC) over a 4.6mm x 50 mm x 5 μ m SEC column at 0°C using a running buffer of TBS (80 mM tris, pH 8.0, 150 mM NaCl, 2.5% DMSO) at a flowrate of 2 mL/minute. The eluting SEC fraction-containing protein was identified by UV-VIS detection 30 monitoring at 230 nm and transferred by way of a sample loop to a low-flow (100 μ L/minute) reverse-phase chromatography (RPC) system. The RPC column (Higgins C-18; 1 mm x 50 mm x 5 μ m) is maintained at 60°C to promote dissociation of ligands from the complex. From this RPC column, the ligand

is eluted into a high-resolution mass spectrometer for analysis using a gradient of 5%-95% acetonitrile (0.1% formic acid counterion) in water (w/ 0.1% formic acid) over 5 minute. If any ligand of suitably high affinity was bound 5 to the COX at the time its fraction was collected, the mass spectral analysis will identify its mass. By virtue of the mass encoding the precise combination of building blocks and core can be identified (see U.S. Patent No. 6,147,344 by Annis et al.). If the same compound failed to appear in the 10 diacyl glycerol kinase control experiment, the compound would be identified as a specific ligand of the COX-1. Figure 6 illustrates the separation of protein from unbound small molecules using ALIS.

Control experiments demonstrated that COX-1 screened in 15 this manner enabled known COX-1 ligands to be extracted from large mixtures of small molecules (Figure 7). When a test library composed of 25 μ M meclofenamate, 25 μ M indomethacin, 1 μ M each of various test libraries, these known COX-1 ligands are recovered and identified by the ALIS screening 20 method.

This experiment demonstrated that after screening over 330,000 small drug-like molecules, 41 small molecules were identified as COX-1 ligands, one example of which is shown 25 in Figure 8. These COX-1 ligand molecules were identified in two screens against small libraries, and their single molecule formulations are in preparation for further testing. Furthermore, many of these hits are observed to compete with known COX-1 ligand, meclofenamate, for binding (Figure 9).

30

EXAMPLE 2: IDENTIFICATION OF LIGAND BINDING TO m2 mAChR PROTEIN BY MASS SPECTROSCOPY

A gene construct encoding the m2 subtype of the muscarinic acetylcholine receptor (m2R) was cloned into a 35 baculovirus expression vector according to conventional

cloning methods (see e.g., Baculovirus Expression Vector System, 6th Edition, 1999, Pharmingen, San Diego, CA). The gene construct encoded a polypeptide with an amino terminal methionine followed immediately in frame by the melittin 5 signal sequence (SEQ ID NO:12) followed immediately in frame by the FLAG M1 epitope tag (SEQ ID NO:1) followed immediately in frame by the sequence for the m2 muscarinic acetylcholine receptor (NCBI Accession No. X04708). The full-length polypeptide sequence therefore was:

10

NH2 -

VWTIGYWLKYINSTINPACYALCNATFKKTFKHLLMCHYKNIGATR-
COOH (SEQ ID NO:34)

Upon expression, the mellitin signal sequence is cleaved after Ala(21) revealing 25 an amino terminal FLAG epitope which is bound specifically by the FLAG M1 antibody resin (Sigma; St. Louis, MO). This baculovirus expression vector was used to generate baculovirus that directed the expression of the above polypeptide in insect cells according the conventional methods (Baculovirus Expression Vector System, 6th Edition, 1999, Pharmingen, San Diego, CA).

30 To purify FLAG-tagged m2R, 60 g of insect cells expressing the above polypeptide were suspended in 0.6 L of TBS [50 mM Tris-CL, pH 7.4, 100 mM NaCl], and the sample was homogenized by nitrogen cavitation. The homogenate was subjected to centrifugation at 500 x g for 30 minutes at 4° C to removed non-homogenized cells. The pellet was discarded and the supernatant was subjected to ultracentrifugation at

100,000 x g for 45 minutes at 4° C. The ultracentrifugation supernatant was discarded and the pelleted cell membranes were resuspended in TBS containing 0.5% (w/v) digitonin (TBS-D buffer) to a protein concentration of 2.5 mg/mL. This suspension was incubated, stirring for 60 minutes at 4° C before ultracentrifugation at 100,000 x g for 45

5 minutes at 4° C to pellet insoluble material. The soluble supernatant was applied to a 5 mL column of the FLAG M1 antibody resin pre-equilibrated with TBS-D buffer at a flow rate of 0.7 mL/min for antibody affinity purification. After loading the soluble material onto the FLAG M1 antibody resin, the column was washed with 50 mL of TBS-D buffer and then the FLAG-tagged m2R protein was eluted from the column with TBS-D buffer

10 containing 100 µg/mL of FLAG peptide (Sigma; St. Louis, MO). Eluted column fractions containing purified FLAG-tagged m2R were identified by SDS-PAGE.

To assess the concentration of purified FLAG-tagged m2R protein that was capable of binding muscarinic ligands, glass fiber filter-binding assays were performed according to the method of Peterson (Peterson, G.L., et al (1995) J. Biol. Chem. 15 270:17808).

This m2R preparation consisted of 6 µM m2R in TBS-D with 100 µg/mL of FLAG peptide. Each m2R polypeptide is reversibly associated with a multiplicity of digitonin molecules, creating a membrane protein-detergent complex with a stoichiometry of m2R:digitonin of 1:5-500. This preparation was designated as Stock

20 m2R for use in ALIS sample preparation according to the sample preparation protocol outlined below.

Other stock reagents were prepared. Stock cyclooxygenase 1 (COX) was prepared according to the method in Example 1 to yield a concentration of 6 µM COX in TBS. Stock discrete ligands (Sigma; St. Louis, MO) pirenzepine, quinuclidinyl benzylate

25 (QNB), and atropine were prepared to 400 µM in TBS. Four combinatorial chemical libraries were prepared in dimethyl sulphoxide (DMSO) constituting on average 2500-5000 small drug-like molecules each at a concentration of 400 µM. These four drug libraries were designated NMG-66, NGM-41, NGL-10-A-41, and NGL-116-A-470. Four stock test libraries were prepared containing 400 µM atropine by adding atropine

30 dissolved in DMSO to the individual drug libraries mentioned above to yield Stock

NMG-66 Plus Atropine, Stock NGM-41 Plus Atropine, Stock NGL-10-A-41 Plus Atropine, and Stock NGL-116-A-470 Plus Atropine. Four stock test libraries were prepared containing 400 μ M QNB by adding QNB dissolved in DMSO to the individual drug libraries mentioned above to yield Stock NMG-66 Plus QNB, Stock NGM-41 Plus QNB, Stock NGL-10-A-41 Plus QNB, and Stock NGL-116-A-470 Plus QNB. Premix Buffer was prepared by combining 100 μ L of 5% digitonin, with 4.6 mL water, and 400 μ L 1 M Tris-Cl, pH 7.5, then equilibrated at 42 $^{\circ}$ C.

Binding reactions were prepared that combined protein (either m2R test protein or COX control protein) with ligand (either QNB alone, atropine alone, pirenzepine alone, 10 atropine plus drug library, or QNB plus drug library) or protein with DMSO as a control. In each case, 38 μ L of Premix Buffer was dispensed into polypropylene tubes containing 2 μ L of DMSO or DMSO-solubilized ligands, mixed by vortexing, and centrifuged at 8,000 x g for 10 minutes at room temperature to remove insoluble material. The clarified supernatants (2 μ L) containing either aqueous DMSO alone or aqueous DMSO-15 solubilized ligands (with or without drug libraries) were transferred to polypropylene tubes at 4 $^{\circ}$ C. Target protein (8 μ L) m2R or control (8 μ L) protein COX was added to the supernatants, mixed well by pipetting, and incubated at 4 $^{\circ}$ C for 60 minutes.

These binding reaction preparations were then subjected to ALIS analysis. The binding reaction preparations combine 4.8 μ M target membrane protein (m2R) or 4.8 μ M 20 control membrane protein (COX) with a multiplicity of approximately 2500 small drug like molecules each at a concentration of 1-10 μ M in a manner that established equilibrium binding conditions. High affinity ligands ($K_{id} < 100 \mu$ M) to the proteins are then identified by ALIS. Small molecule ligands of the target protein m2R that do not also bind to the control protein COX are considered as specific ligands of the target 25 protein. Separately, for comparison to experiments with a multiplicity of drug molecules, binding reactions were also prepared combining m2R or COX with individual (discrete) m2R ligands. This ALIS Analysis proceeded as described below with a series of size exclusion chromatography (SEC), followed by reverse phase chromatography (RPC), followed by mass spectrometric (MS) analysis.

These prepared binding reaction mixtures were individually subjected to ALIS Analysis. Ligands that bound to the m2R with suitably high affinity were collected with the protein-containing SEC fraction as follows. The large detergent-solubilized molecules were separated from the unbound small drug-like molecules by SEC over a 4.6 mm x 50 mm x 5 μ m SEC column at 4°C using a running buffer of 50 mM Tris-Cl, pH 7.5, 150 mM NaCl, 2.5% DMSO at a flowrate of 2 mL/minute. The protein containing fraction was identified with ultraviolet electronic absorption spectrometry monitoring at 230 nm.

The protein-containing fraction was transferred by way of a sample loop to a low flowrate (100 μ L/min RPC system. The RPC column (Higgins C-18; 1 mm x 50 m x 5 μ m) is maintained at 60 °C to promote ligand dissociation from the complex. From this RPC column the ligand is eluted into a high-resolution mass spectrometer for analysis using a gradient of 5%-95% acetonitrile (0.1% formic acid counterion) in water (w/ 0.1% formic acid) over 5 minutes. Mass analyzed ligands collected with the protein-containing SEC fraction by virtue of its high affinity for the protein-detergent m2R complex were identified by fore-knowledge of their precise mass.

Experiments demonstrated that m2R screened by ALIS Analysis in this manner enabled known m2R ligands to be extracted from mixtures of a multiplicity of small drug like molecules by virtue of the known m2R ligands' high affinity for the m2R-detergent complex. This ALIS-formatted screen recovered m2R ligands from drug libraries just as well as it recovered m2R ligands bound to the m2R-detergent complex in the absence of drug libraries (Figure 10).

Data for these experiments are presented in Figure 10. In these experiments, equilibrium binding reactions were established by combining 2.0 μ M m2R with 10 μ M pirenzepine, QNB, or atropine in the absence or presence of combinatorial drug libraries (NGM-66, NGM-340, NGL-10-A-41, NGL-116-A-470) that presented approximately 2500 small drug-like molecules each at a concentration of 1-10 μ M. The binding reactions were subjected to ALIS Analysis and the extent of ligand recovery was quantified by the signal strength of the mass spectrometer. The x-axis is in relative units of mass spectrometric signal response for the respective masses of pirenzepine, QNB, and atropine.

EXAMPLE 3: DISPLACEMENT ASSAY IN AN AFFINITY-BASED
SELECTION AND ALIS IDENTIFICATION OF HP
LIGANDS

5 As a representative HP, m2 mAChR is purified according to the method of Peterson *et al.* (Peterson, G.L. *et al.* (1995) *J. Biol. Chem.* 270: 17808). The target protein is adjusted to a concentration of 20 μ M in a buffer of TBS-AGD and is incubated with a known muscarinic ligand, pirenzepine
10 (MW = 424.3), which is at a concentration of 1 μ M. As a control test, an unrelated membrane protein, glycophorin, is also prepared in TBS-AGD at 20 μ M and is incubated with the compound pirenzepine (MW = 424.3), which is at a concentration of 1 μ M.

15 A library of mass-coded compounds is added to the m2 mAChR/pirenzepine mixture, and the sample is analyzed to determine if a library compound displaces pirenzepine from the HP protein. Displacement of pirenzepine indicates that the library compound binds more tightly and at the same site
20 as pirenzepine itself.

The displacement assay is conducted as follows. The mixture of m2 mAChR, 1 μ M pirenzepine, and 1 μ M of each library compound are subjected to ALIS Analysis. In this analysis MS signal corresponding to the mass of pirenzepine
25 is monitored, while the mass of the library compounds are ignored. If the library compound quantitatively reduces the MS signal corresponding to the mass of pirenzepine, it is inferred that the library compound displaced pirenzepine from the HP protein, in this case mAChR protein. If
30 incubation with the library compounds does not alter the MS signal corresponding to the mass of pirenzepine, the library compounds are considered not to contain an m2 mAChR ligand. By comparing pirenzepine MS signal with and without incubation with the library compounds, one can assess

whether the library compound displaces pirenzepine and thus binds to the mAChR protein.

5 **EXAMPLE 4: AFFINITY SELECTION OF m2 mAChR MASS-CODED
LIGANDS AND IDENTIFICATION BY ALIS**

As a representative HP, m2 mAChR is purified according to the method of Peterson *et al.* (Peterson, G.L. (1995) *J. Biol. Chem.* 270: 17808). The protein is adjusted to 20 μ M in a buffer of TBS-AGD is incubated with a 2500-member library of mass-coded compounds, each member at a concentration of 1 μ M. After a 30 minute incubation at 22°C, the sample was chilled at 4°C pending ALIS analysis. As a control test, an unrelated membrane protein, glycophorin, is also prepared in TBS-AGD at 20 μ M and incubated with the mass-coded library. To determine if the compound specifically binds to the mAChR, the mAChR-compound mixture is analyzed by ALIS Analysis. If a mass corresponding to one of the members of the mass-coded library appears when the protein peak is collected and surveyed by MS, that compound may be identified as a binding ligand. If the same compound fails to appear in the glycophorin control experiment, the compound may then be identified as a specific ligand of the mAChR. By virtue of the mass encoding the precise combination of building blocks and core can be identified (see U.S. Patent No. 6,147,344 by Annis *et al.*). Using MS-MS analysis (see U.S. Patent No. 6,147,344 by Annis *et al.*), the exact structure of the core plus building block combination can also be pinpointed.

30 **EXAMPLE 5: AFFINITY SELECTION OF COX-1 LIGANDS AND
IDENTIFICATION BY MODIFIED ALIS WITH ON-LINE
FLUORESCENCE DETECTION**

As a representative HP, COX-1 protein was purified from ram seminal vesicles according to the method of Johnson *et al.* (Johnson, J.L. (1995) *Arch. Biochem. Biophys.* 324:26-34). The COX-1 sample is adjusted to 20 μ M in TBS-AGD (50

mM tris, pH 8.0, 150 mM NaCl, 800 mM dodecyl β -D-maltoside, 2.5% DMSO) is mixed and incubated with a 2500-member library of mass-coded compounds, each member at a concentration of 1 μ M. After a 30 minute incubation at 22°C, the sample was 5 chilled at 4°C pending ALIS analysis. As the total volume is 12 μ L, the sample thus contains 240 pmol protein and 12 pmol of each library component. As a control test, an unrelated membrane protein, glycophorin, is also prepared in TBS-AGD at 20 μ M and incubated with the same 2500-member 10 library and treated similarly.

Then the mixtures are individually subjected to modified ALIS analysis as follows. The large detergent-solubilized protein is separated from the small drug-like molecules by size exclusion chromatography (SEC) over a 15 4.6mm x 50 mm x 5 μ m SEC column at 0°C using a running buffer of TBS (50 mM tris, pH 8.0, 150 mM NaCl, 2.5% DMSO) at a flowrate of 2 mL/minutes. The eluting SEC fraction containing protein is identified by on-line fluorescence detection exciting at 240-250 nm and monitoring emission at 20 340 nm and transferred by way of a sample loop to a low-flow (100 μ L/minute) reverse-phase chromatography (RPC) system. The RPC column (Higgins C-18; 1 mm x 50 mm x 5 μ m) is maintained at 60°C to promote dissociation of ligands from 25 the complex. From the RPC column, the ligand is eluted into a high-resolution mass spectrometer for analysis using a gradient of 5%-95% acetonitrile (0.1% formic acid counterion) in water (w/ 0.1% formic acid) over 5 minutes. Ligand of suitably high affinity bound to the COX-1 at the 30 time its fraction is collected, and the mass of the ligand is identified by mass spectral analysis.

Through the mass coding, the precise combination of building blocks and core molecule are identified (see U.S. Patent No. 6,147,344 by Annis et al.). If the same compound fails to appear in the glycophorin control experiment, the

compound may then be identified as a specific ligand of the COX-1 protein.

5 **EXAMPLE 6: AFFINITY SELECTION OF COX-1 LIGANDS AND
IDENTIFICATION BY MODIFIED ALIS WITH ON-LINE
LIGHT SCATTERING DETECTION**

As a representative HP, COX-1 protein was purified from ram seminal vesicles according to the method of Johnson *et al.* (Johnson, J.L. (1995) *Arch. Biochem. Biophys.* 324:26-34). The COX-1 sample is adjusted to 20 μ M in TBS-AGD (50 mM tris, pH 8.0, 150 mM NaCl, 800 mM dodecyl β -D-maltoside, 2.5% DMSO) is mixed and incubated with a 2500-member library of mass-coded compounds, each member at a concentration of 1 μ M. After a 30 minute incubation at 22°C, the sample is chilled at 4°C pending modified ALIS analysis. As the total volume is 12 μ L, the sample contains 240 pmol protein and 12 pmol of each library component. As a control test, an unrelated membrane protein, glycophorin, is also prepared in TBS-AGD at 20 μ M and incubated with the same 2500-member library and treated similarly.

Next, the control and test mixtures are individually subjected to modified ALIS analysis as follows. The large detergent-solubilized protein is separated from the small drug-like molecules by size exclusion chromatography (SEC) over a 4.6mm x 50 mm x 5 μ m SEC column at 0°C using a running buffer of TBS (50 mM tris, pH 8.0, 150 mM NaCl, 2.5% DMSO) at a flowrate of 2 mL/minute. The eluting SEC fraction containing protein is identified by on-line light scattering detection and transferred by way of a sample loop to a low-flow (100 μ L/minute) reverse-phase chromatography (RPC) system. The RPC column (Higgins C-18; 1 mm x 50 mm x 5 μ m) is maintained at 60°C to promote dissociation of ligands from the complex. From the RPC column, the ligand is eluted into a high-resolution mass spectrometer for

analysis using a gradient of 5%-95% acetonitrile (0.1% formic acid counterion) in water (w/ 0.1% formic acid) over 5 minutes. Ligand of suitably high affinity bound to the COX-1 protein at the time its fraction is collected, and the 5 mass of the ligand is identified by mass spectral analysis.

Through the mass coding, the precise combination of building blocks and core molecule are identified (see U.S. Patent No. 6,147,344 by Annis et al.). If the same compound fails to appear in the glycophorin control experiment, the 10 compound may then be identified as a specific ligand of the COX-1 protein.

EXAMPLE 7: HETEROGENEOUS SOLUTION PHASE SCREENING FOR
15 LIGANDS THAT BIND m2 mAChR: IDENTIFICATION
USING AFFINITY SELECTION AND ALIS ANALYSIS

HP ligands may also be screened by utilizing a heterogeneous solution phase screening method in which a tagged target sequence is immobilized on a solid support. For example, anti-flag antibody-loaded protein A agarose 20 beads (anti-flag beads) are prepared for use as a sedimentable stationary element in an immunoprecipitation (IP)-based screening protocol.

Briefly, using a buffer of TBS-AG (50 mM tris, pH 8.0, 150 mM NaCl, 800 mM dodecyl β -D-maltoside), 100 μ L of 50% 25 v/v slurry of protein A agarose (Santa Cruz Biotechnology, St. Louis, MO.) are washed in a 1.5 mL eppendorf tube with three room temperature cycles of: (1) combining the beads with 1 mL TBS-AG; (2) mixing the sample by tumbling for 20 minutes; and (3) centrifugation at 10000xg, followed by a 30 careful removal of the supernatant that leaves the pelleted agarose beads in the bottom of the tube.

After the beads have been washed, the 50 μ L pellet of beads is brought up in 1.0 mL TBS-AG. To that mixture, 50 μ L of 1 mg/mL β -galactosidase in TBS-AG buffer is added and 35 the mixture is incubated at 4°C for 60 minutes to block non-

specific binding of protein to the beads. To that mixture is added 10 μ L of 1.0 μ g/mL anti-flag antibody (Sigma, St. Louis, Montana), and the mixture is incubated at 4°C for 60 minutes. In parallel, another preparation of control agarose beads handled similarly is treated with 10 μ L of TBS-AG instead of the anti-flag antibody. The anti-flag loaded beads and the control beads are then washed to remove excess antibody and protein and, finally, resuspended in 0.10 mL of TBS-AG buffer and transferred to 0.5 mL eppendorf tubes.

CHO cells expressing an m2 mAChR-flag tag-His tag protein are cultured, lysed, and homogenized. The m2 mAChR-containing membranes of the cells are purified by sucrose step-gradient ultracentrifugation. This sucrose step-gradient ultracentrifugation step removes most non-membrane proteins and cell debris. The ultracentrifugation step also has the potential of isolating specific populations of membranous cellular substructures. The mAChR-enriched membranes are solubilized with detergent (dodecyl- β -maltoside, D β M or CYMAL-7; (Anatrace; Maumee, OH)) and subjected to three steps of affinity purification.

First, metal chelate affinity chromatography (MCAQ will be used to take advantage of the polyhistidine-tagged C-terminus, followed by a second affinity purification, an antibody affinity purification based on the FLAG-tagged N-terminus (Kobilka, B.K. (1995) *Anal. Biochem.* 231: 269). Third, ligand affinity purification over a column of immobilized mAChR ligand 3-(2'-aminobenzhydryloxy)-tropane (ABT), followed by a desalting step will yield a final enrichment of active m2 mAChR protein.

The sample is adjusted to 20 μ M m2 mAChR protein in a buffer of TBS-AGD and is incubated with a 2500-member library of mass-coded compounds, each member at a concentration of 1 μ M. The reaction is done in a volume of

40 μ L. After a 30 minute incubation at 22°C, the sample is chilled at 4°C pending MS analysis. As a comparison test, β -galactosidase is similarly prepared in TBS-AGD at 20 μ M and incubated with the mass-coded library.

5 The m2 mAChR protein-compound mixtures are prepared for analysis by MS analysis with the following procedure. The purified protein-library mixtures, either the m2 mAChR protein or β -galactosidase protein trials, are each split into two 20 μ L volumes. For the m2 mAChR-library mixture, 10 one volume is combined with the anti-flag beads (anti-flag/protein A agarose) for IP and the other volume is subjected to a mock IP by combination with the control agarose beads (buffer/protein A agarose beads). Similarly, 15 for the β -galactosidase mixture, one 20 μ L volume is combined with the anti-flag beads for a control IP and the other 20 μ L volume is subjected to a mock IP by combination with the control agarose beads. These IPs proceed, mixed by tumbling, for 60 minutes at 4°C. Afterwards, each IP is washed with three room temperature cycles of: (1) combining 20 the beads with 1 mL TBS-AG, (2) mixing by tumbling for 2 minutes, and (3) centrifugation at 10,000 g, followed by a careful removal of the supernatant that leaves the pelleted agarose beads in the bottom of the tube. Finally, each 50 μ L bed volume bead preparation is then resuspended in an 25 additional 50 μ L of TBS (50 mM tris, pH 8.0, 150 mM NaCl) and kept at 4°C. At the completion of this process, four heterogeneous bead preparations are made: (1) m2 mAChR/anti-flag/protein A agarose (m2 beads), (2) m2 mAChR/buffer/protein A agarose beads (m2 control beads), (3) 30 β -galactosidase/anti-flag/protein A agarose beads (β -lac beads), and (4) β -galactosidase/buffer/protein A agarose beads (β -galactosidase control beads).

These bead-based preparations constitute heterogeneous solution phase systems useful for screening in the following manner. Each 100 μ L bead preparation is combined with 50 μ L of 30% acetonitrile in water heated to 60°C for 5 minutes to 5 dissociate bound ligands from the protein. Then the mixture is centrifuged at 10,000 \times g to pellet the beads, and the dissociated protein in the supernatant is transferred to a new tube.

The IP procedure allows both an affinity selection of a 10 ligand and the physical separation of the m2mAChR-ligand complex from unbound library members. These supernatants contain 50 mM tris, pH 8.0, 150 mM NaCl, 80 mM dodecyl β -D-maltoside, and 10% acetonitrile. Approximately 60 μ L of these supernatant samples are injected individually into a 15 low-flow (100 μ L/minutes) reverse-phase chromatography (RPC) system. The RPC column (Higgins C-18; 1 mm \times 50 mm \times 5 μ m) is maintained at 60°C. From this RPC column, the ligand is eluted into a high-resolution mass spectrometer for analysis using a gradient of 5%-95% acetonitrile (0.1% formic acid 20 counterion) in water (w/ 0.1% formic acid) over 5 minutes.

m2 mAChR-ligands are identified by observing a mass corresponding to one compounds from the 2500-member mass-coded library in the supernatant of the m2mAChR protein beads and not from the supernatant of the m2mAChR protein 25 control, β -lac library, or β -lac control beads. The structure of the mass-coded compounds selected in the procedure are easily identified (see U.S. Patent No. 6,147,344 by Annis et al.). Using MS-MS analysis (see U.S. Patent No. 6,147,344 by Annis et al.), the exact structure 30 of the core plus building block combination can also be pinpointed.

EXAMPLE 9: HETEROGENEOUS SOLUTION PHASE SCREENING FOR LIGANDS THAT BIND m2 mAChR: IDENTIFICATION

**USING A DISPLACEMENT ASSAY COMBINED WITH
AFFINITY SELECTION AND MS ANALYSIS**

Flag-tagged m2 mAChR protein is purified as outlined herein above and resuspended at a concentration of 20 μ M in 5 a buffer of TBS-AGD. The protein is incubated with a 2500-member library of mass-coded compounds, each member at a concentration of 1 μ M and with 1 μ M pirezepine, a known ligand for m2 mAChR protein, in a volume of 40 μ L. After a 30 minute incubation at 22°C, the sample was chilled at 4°C 10 pending MS analysis. As a comparison test, β -galactosidase is similarly prepared in TBS-AGD at 20 μ M and incubated with the mass-coded library and pirezepine.

The purified protein-library-pirenzepine mixtures, from either the m2 mAChR protein or β -galactosidase trials, are 15 each split into two 20 μ L volumes. For the m2 mAChR-library-pirenzepine mixture, one volume is combined with the anti-flag beads (anti-flag/protein A agarose) for IP and the other volume is subjected to a mock IP by combination with the control agarose beads (buffer/protein A agarose beads). 20 Protein A agarose beads are prepared as previously described herein. Similarly, for the β -galactosidase mixture, one 20 μ L volume is combined with the anti-flag beads for a control IP and the other 20 μ L volume is subjected to a mock IP by combination with the control agarose beads. These IPs 25 proceed, mixed by tumbling, for 60 minutes at 4°C. Then each IP is washed with three room temperature cycles of: (1) combining the beads with 1 mL TBS-AG; (2) mixing by tumbling for 2 minutes; and (3) centrifugation at 10,000 \times g, followed by a careful removal of the supernatant that leaves 30 the pelleted agarose beads in the bottom of the tube. Finally, each 50 μ L bed volume bead preparation is then resuspended in an additional 50 μ L of TBS (50 mM tris, pH 8.0, 150 mM NaCl) and kept at 4°C. At the completion of

this process, four heterogeneous bead preparations are made: (1) m2 mAChR/anti-flag/protein A agarose (m2 beads); (2) m2 mAChR/buffer/protein A agarose beads (m2 control beads); (3) β -galactosidase/anti-flag/protein A agarose beads (β -galactosidase beads), and (4) β -galactosidase/buffer/protein A agarose beads (β -galactosidase control beads).

These bead-based preparations constitute heterogeneous solution phase systems useful for screening in the following manner. Each 100 μ L bead preparation is combined with 50 mL of 30% acetonitrile in water heated to 60°C for 5 minutes to dissociate any bound pirenzepine from the protein. Then the mixture is centrifuged at 10,000 \times g to pellet the beads, and dissociated protein in the supernatant is transferred to a new tube. The IP procedure allows both an affinity selection of the ligand and the physical separation of the m2 mAChR-ligand complex from unbound library members. These supernatants contain 50 mM tris, pH 8.0, 150 mM NaCl, 80 mM dodecyl β -D-maltoside, 10% acetonitrile, and <50 pmol of pirenzepine. Approximately 60 μ L of these supernatants are injected into low-flow (100 μ L/minute) reverse-phase chromatography (RPC) system. The RPC column (Higgins C-18; 1 mm \times 50 mm \times 5 μ m) is maintained at 60°C. From this RPC column, the ligand is eluted into a high-resolution mass spectrometer for analysis using a gradient of 5%-95% acetonitrile (0.1% formic acid counterion) in water (w/ 0.1% formic acid) over 5 minutes.

The mass corresponding to pirenzepine from the supernatant of the m2 mAChR protein control, β -galactosidase library test, or β -galactosidase control beads should be higher than the pirenzepine mass response in the MS analysis of the m2 mAChR protein beads. It is then inferred that the 2500-member mass-coded library contains a ligand that binds to the m2 mAChR protein with an affinity

greater than that of pirenzepine. Libraries that contain hits can thus be detected and selected from among other libraries that do not contain hits.

5 **EXAMPLE 10: ENHANCING THE HYDROPHOBIC PROTEIN
SCREENING SUCCESS BY MULTIPLEXING**

To maintain the amphiphile-solubilized HP in a three-dimensional conformation that enhances the success of screening, HPs are multiplexed in the preparation of 10 screening samples. Multiplexing is defined to mean any method of preparation wherein the target protein is combined with some known molar equivalent of one or more accessory proteins (APs). Five independent criteria are identified to 15 guide the selection of most favorable screening conditions with regard to the use of APs: (1) in the presence of the AP(s), the target HP is observed to bind a known agonist with greater affinity than without the AP(s) present; (2) in the presence of the AP(s), the target HP is observed to bind a known antagonist with greater affinity than without the 20 AP(s) present; (3) in the presence of the AP(s), the HP is shown to have greater functional activity as assayed by enzymatic, *in vitro*, or cell-based assays; (4) in the presence of the AP(s), the HP is shown to alter its state of multimerization; and (5) in the presence of the AP(s), the 25 HP is shown to have greater conformational stability or uniformity.

As a first example, a method for multiplexed screening of m2 mAChR with $G_{\alpha_1\beta_1\gamma_2}$ -Guanosine-diphosphate (GDP) as a heterotrimeric AP is presented. The $G_{\alpha_1\beta_1\gamma_2}$ --GDP complex was 30 identified as an AP for the m2 mAChR because its presence enhanced the affinity of the m2 mAChR for an antagonist, N-methylscopolamine (NMS) by 5-fold as demonstrated by the following method. 3 H-NMS binding assays performed by the method of Rinken and Haga (Rinken, A. and Haga, T. (1993) 35 *Arch. Biochem. Biophys.* 301:158-164) showed that the

apparent K_d of m2 mAChR for 3H-NMS was 0.17 nM while K_d of the m2 mAChR- $G_{\alpha_{11}\beta_1\gamma_2}$ -GDP complex was 432 nM. To screen this HP/AP complex, m2 mAChR/ $G_{\alpha_{11}\beta_1\gamma_2}$ -PLs were prepared as described in Example 11 and screened for ligand binding 5 according to any of the methods utilizing affinity selection and ALIS or modified ALIS presented herein with the addition of 50 μ M GDP to the binding buffer at the stage of incubation with the ligand compounds.

As a second example, multiplexed screening of 10 heterodimerized κ and δ subtypes of the human opioid receptor is presented. The human κ opioid receptor was identified as an AP for the human δ opioid receptor because its presence caused the multimerization state of the human δ opioid receptor to change from monomer to heterodimer as 15 demonstrated by the method of Jordan and Devi (Jordan, B.A. and Devi, L.A., (1999) *Nature* 399:697-708).

To prepare the δ/κ opioid receptor heterodimer complex for screening, the following method is used. Human κ -opioid receptor is purified and dialyzed into TBS-AG at a 20 concentration of 50 μ M. Human δ -opioid receptor is purified and dialyzed into TBS-AG at a concentration of 50 μ M. Equal volumes of these two preparations were combined to allow them to dimerize.

The heterodimerized opioid receptor complex is then 25 screened for ligand binding according to any of the methods utilizing affinity selection and ALIS or modified ALIS presented herein.

30 **EXAMPLE 11: METHODS FOR THE PREPARATION OF DEFINED GPCR PROTEOLIPOSOMES (GPCR-PL)**

To add conformational stability to detergent-solubilized GPCRs, the detergent micelle solubilization is exchanged for solubilization in defined proteoliposomes meeting the following criteria: (1) the lipid composition of

the PL is defined and characterized as having no more than six discrete lipid entities making up 90% of the lipid content of the PL; (2) 90% of the HP-PL preparation has a defined, unimodal size distribution of particles spanning no 5 more than three orders of magnitude and wherein mean particle size is in the range of 5-10000 nm; (c) the PL preparation yields >50 nM HP.

To prepare HP-PL bearing m₂ mAChR protein, the following procedure is used. Synthetic lipids (Avanti Polar 10 Lipids, Alabaster, AL) D-ribo-phytosphingosine-1-phosphate and ceramide-C18:0 each in chloroform are combined in a volume of 1 mL each at 5 mM in a glass test tube, and the chloroform is evaporated at room temperature under a stream of argon for 24 hrs. The lipid residue is then wetted with 15 0.40 mL of TBS, sonicated for 30 minutes at 28°C, and the mixture is transferred to a 1.5 mL polypropylene tube. To this lipid mixture is added 0.2 mL 50 μM m₂ mAChR prepared as described in Peterson, G.L. et al. (Peterson, G.L. et al. (1995) *J. Biol. Chem.* 270: 17808). This yields a crude 20 mixture of lipid and protein.

The crude protein-lipid mixture is then incubated for 3 hours at 8°C with 5 minute, 22°C bath sonication at 30 minute intervals (6 times). This mixture is then subjected to 11 passages through a 100 nm polycarbonate membranes in a small 25 volume extruder according to the manufacturer's protocol (Avanti Polar Lipids, Alabaster, AL) at 20°C. This yields a crude PL preparation of 0.6 mL volume, 16 μM m₂ mAChR, and excess amphiphile (DbM and lipid). To remove excess lipid and detergent, the crude PL preparation is passed through a 30 10.0 mL desalting (G-50 sephadex column) previously equilibrated with TBS at 4°C. After application of the crude PL preparation to the desalting column, TBS at 4°C is used to elute the material from the column. This desalting procedure is conducted with a flow rate of 0.5 mL/minute. 35 The protein concentration is estimated by combining a 10 μL

sample with 10 μ L of 0.2% Triton X-100 and using that mixture in a Bio-Rad colorimetric protein assay (Bio-Rad Inc., Hercules, CA). The concentration is then adjusted by dilution with TBS to 10 μ M.

5 The size distribution is defined using a Coulter N4 submicron particle analyzer following the manufacturer's protocols. An independent assessment of size distribution and mean particle size is accomplished by analytical SEC by injecting 20 μ L onto an analytical SEC column with a running
10 buffer TBS at a flow rate of 1.0 mL/minute (G2000_{swxl}, 5 x 300 mm, 5 μ m; ToSo-Haas), fitted with a UV detector monitoring at 280 nm, and chilled to 12°C. A single peak eluting at 8.23 minutes identified the retention time of the GPCR-PL's which was compared to standard curve of molecular size
15 marker elution times and indicated that the mean apparent size was comparable to that of a 940,000 dalton protein.

Proteoliposomes may also be prepared with HPs complexed with APs. In this procedure, detergent micelle solubilization is exchanged with solubilization in defined
20 proteoliposomes meeting the following criteria: (1) the lipid composition of the PL was defined and characterized as having no more than six discrete lipid entities making up 90% of the lipid content of the PL; (2) 90% of the HP-PL preparation has a defined, unimodal size distribution of
25 particles spanning no more than three orders of magnitude and wherein mean particle size is in the range of 5-10000 nm; (3) the PL preparation yields >50 nM HP; (4) the PL preparation included at least one other protein designated the accessory protein (AP), the presence of which supports
30 the maintenance of a favorable conformation for the target HP.

To prepare HP-PL bearing m2 mAChR, the following procedure was used. Synthetic lipids (Avanti Polar Lipids, Alabaster, AL) D-ribo-phytosphingosine-1-phosphate and
35 ceramide-C18:0 each in chloroform are combined in a volume

of 1 mL each at 5 mM in a glass test tube and the chloroform is evaporated at room temperature under a stream of argon for 24 hrs. The lipid residue is then wetted with 0.40 mL of TBS plus 2 mM MgCl₂ (TBSM), sonicated for 30 minutes at 5 28°C, and mixture transferred to a 1.5 mL polypropylene tube. Separately, 50 μM G_{αi1β1γ2} was prepared by combining equal volumes of 100 μM G_{αi1} with 100 μM G_{β1γ2} purified as described (ref) and dialyzed into TBSM plus 800 mM DbM (TBSM-AG). To the lipid mixture is added 0.2 mL 50 μM m2 10 mAChR prepared as described in Peterson, G.L. et al. (Peterson, G.L. et al. (1995) *J. Biol. Chem.* 270: 17808) and 0.2 mL 50 μM G_{αi1β1γ2}. To this mixture is added 10 μL of 50 mM GDP. This yields a crude mixture of lipid, HP, and AP.

The crude HP/AP-lipid mixture is then incubated for 3 15 hours at 8°C with 5 minute, 22°C bath sonication at 30 minute intervals (6 times). This mixture is then subjected to 11 passages through a 100 nm polycarbonate membranes in a small volume extruder according to the manufacturer's protocol (Avanti Polar Lipids, Alabaster, AL) at 20°C. This yields a 20 crude PL preparation of 0.8 mL volume, 12 μM mAChR, 12 μM G_{αi1β1γ2}, and excess amphiphile (DbM and lipid). To remove excess lipid and detergent, the crude PL preparation is passed through a 10.0 mL desalting (G-50 sephadex column) 25 previously equilibrated with TBS at 4°C. After application of the crude PL preparation to the desalting column, TBS at 4°C is used to elute the material from the column. This desalting procedure is conducted with a flow rate of 0.5 mL/minute. The protein concentration is estimated by 30 combining a 10 μL sample with 10 μL of 0.2% Triton X-100 and using that mixture in a Bio-Rad colorimetric protein assay following the manufacturer's instructions. The concentration is then adjusted by dilution with TBS to 20 μM.

To define size distribution, a Coulter N4 submicron particle analyzer is used according to the manufacturers

protocol. An independent assessment of size distribution and mean particle size is accomplished by analytical SEC by injecting 20 μ L onto an analytical SEC column with a running buffer TBS at a flow rate of 1.0 mL/minute (G2000_{swxl}, 5 x 300 mm, 5 μ m; ToSo-Haas), fitted with a UV detector monitoring at 280 nm, and chilled to 12°C. A single peak eluting at 8.23 minutes post-injection identified the retention time of the HP/AP-PL's which is compared to standard curve of molecular size marker elution times. The resultant mean apparent size is comparable to that of a 940,000 dalton protein.

Control AP-PLs for use as screening controls are made to meet the following criteria: (1) the lipid composition of the PL was defined and characterized as having no more than six discrete lipid entities making up 90% of the lipid content of the PL; (2) 90% of the HP-PL preparation has a defined, unimodal size distribution of particles spanning no more than three orders of magnitude and wherein mean particle size is in the range of 5-10000 nm; (3) the PL preparation is designed to exactly mimic the analogous HP/AP-PL except no target HP is present.

To prepare AP-PL bearing m2 mAChR, the following procedure is used. Synthetic lipids (Avanti Polar Lipids, Alabaster, AL) D-ribo-phytosphingosine-1-phosphate and ceramide-C18:0 each in chloroform are combined in a volume of 1 mL each at 5 mM in a glass test tube and the chloroform is evaporated at room temperature under a stream of argon for 24 hours. The lipid residue is then wetted with 0.40 mL of TBS plus 2 mM MgCl₂ (TBSM), sonicated for 30 minutes at 28°C, and mixture transferred to a 1.5 mL polypropylene tube. Separately, 50 μ M G _{$\alpha_{i1}\beta_1\gamma_2$} was prepared by combining equal volumes of 100 μ M G _{α_{i1}} with 100 μ M G _{$\beta_1\gamma_2$} purified as described Hou, Y. et al., *J. Biol. Chem.* (2000) 275:38961-6 and dialyzed into TBSM plus 800 mM DbM (TBSM-AG). To the lipid mixture is added 0.2 mL TBS-AG and 0.2 mL 50 μ M G _{$\alpha_{i1}\beta_1\gamma_2$} .

To this mixture is added 10 μ L of 50 mM GDP. This yields a crude mixture of lipid and AP. The protein concentration is estimated by combining a 10 μ L sample with 10 μ L of 0.2% Triton X-100 and using that mixture in a Bio-Rad 5 colorimetric protein assay following the instructions of the manufacturer. The concentration is then adjusted by dilution with TBS to 10 μ M.

This crude AP-lipid mixture is then incubated for 3 hours at 8°C with 5 minute, 22°C bath sonication at 30 minute 10 intervals (6 times). This mixture is then subjected to 11 passages through a 100 nm polycarbonate membranes in a small volume extruder according to the manufacturer's protocol (Avanti Polar Lipids, Alabaster, AL) at 20°C. This yields a crude PL preparation of 0.8 mL volume, 12 μ M mAChR, 12 μ M 15 $G_{\alpha_{11}\beta_1\gamma_2}$, and excess amphiphile (DbM and lipid). To remove excess lipid and detergent, the crude PL preparation is passed through a 10.0 mL desalting (G-50 sephadex column) previously equilibrated with TBS at 4°C. After application of the crude PL preparation to the desalting column, TBS at 20 4°C is used to elute the material from the column. This desalting procedure is conducted with a flow rate of 0.5 mL/minute.

To define size distribution, a Coulter N4 submicron particle analyzer is used according to the manufacturers 25 protocol. An independent assessment of size distribution and mean particle size is accomplished by analytical SEC by injecting 20 μ L onto an analytical SEC column with a running buffer TBS at a flow rate of 1.0 mL/minute (G2000_{SWXL}, 5 x 300 mm, 5 μ m; ToSo-Haas), fitted with a UV detector monitoring 30 at 280 nm, and chilled to 12°C. A single peak eluting at 8.23 minutes identified the retention time of the AP-PL's which is compared to standard curve of molecular size marker elution times. The resultant mean apparent size is comparable to that of a 940,000 dalton protein.

The proteoliposomes described herein are then screened for ligand binding according to any of the methods utilizing affinity selection and ALIS or modified ALIS presented herein.

5

EXAMPLE 12: DUAL EPITOPE AFFINITY PURIFICATION OF HPs

The construction of nucleic acid sequences encoding the tagged HP proteins of the invention is well within the skill of those in the art, utilizing routing procedures common in 10 the art of nucleic acid cloning.

Tagged-HPs, e.g., Mellitin-Flag Tag-Human m1 mAChR-EE-tag protein or Mellitin-Flag Tag-Human Beta 2 Adrenergic Receptor-EE-tag protein, are produced from a recombinant baculovirus following the methodology provided by the 15 manufacturer of the viral expression system (Pharmingen, San Diego, CA).

Briefly, recombinant virus is selected based on its ability to direct the expression of the recombinant protein(s). Protein expression is confirmed by western blot 20 analysis of detergent-solubilized cell lysates of the infected insect cells. Using primary antibodies that recognize either the Flag epitope, the EE epitope, or the HP protein itself, the western blot reveals whether or not, and to what degree, the HP proteins are expressed. If possible, 25 a functional assay is performed to determine that the expressed protein is functional. For example, for the Mellitin-Flag Tag-Human m1 mAChR-EE-tag protein, a cell-based ³H-N-methylscopolamine binding analyses is performed by the method of Rinken and Haga (Rinken, A. and Haga, T. 30 (1993) *Arch. Biochem. Biophys.* 301:158-164) confirmed that the virus-directed protein expression was functional, indicating a *B*_{max} of 0.5×10^6 receptors per cell and a *Kd* of 0.10 nM. This baculovirus was then amplified by to a high 35 titer of 2.0×10^8 pfu/mL by conventional methods (Pharmingen, San Diego, CA).

Next, large-scale insect cell cultures are obtained for the isolation of the proteins. Briefly, once high titer virus stocks are generated the constructs of interest, ten 10 liter production runs were executed, growing Sf21 insect 5 cells to a density of 2×10^6 cells/mL in a bioreactor with wave agitation (Wave Biotechnology, Bedminster, NJ). For each protein produced, these cells were inoculated with high titer virus stock at an multiplicity of infection (MOI) of 5 and two days post-infection the cells were harvested.

10 The HP proteins are then solubilized. For example, mAChR protein expressing cells are collected by centrifugation for 30 minutes at 10,000 x g. The cell pellets from all ten bioreactor production runs are combined, and the cell pellets are suspended in 500 mL of 15 ice cold TBS buffer plus 1 mM EDTA, 10 μ g/ml pepstatin and 1 μ g/ml pmethylsulfonylfluoride, and 20 mM dodecyl- β -D-maltoside (DbM). This cell slurry is subjected to 50 strokes in a pestle A dounce homogenizer at 4°C to break open the cells and solubilize the membrane proteins. To 20 clarify this suspension, the material is centrifuged for 60 minutes at 40000xg at 4°C to remove insoluble material. The supernatant is then collected and used as a source of soluble Mellitin-Flag Tag-Human m1 mAChR-EE protein. (Note: The honey bee mellitin signal sequence is cleaved off by 25 cellular proteases in the process of expression and trafficking to the plasma membrane of the insect cell. From this point on the solubilized protein is referred to as Flag Tag-Human m1 mAChR-EE.)

30 Each solubilized recombinant HP is then purified with two rounds of affinity purification over an antibody affinity column. Both the anti-EE-tag and anti-Flag-tag columns are prepared similarly. Briefly, 35 mg of purified anti-epitope antibody is dialyzed into coupling buffer and coupled to 10 mL CNBr-activated sepharose beads according 35 the manufacturers protocol (Amersham Pharmacia, Piscataway,

NJ). The resin is then transferred to a 1.2 x 15 cm polypropylene column, and the epitope affinity columns are then equilibrated with TBS-AG at 4°C.

Next, 50 mL of solubilized HP protein, e.g., FlagTag-5 Human m1 mAChR-EE, is applied to the anti-EE affinity column at a flow rate of 0.2 mL per minute. The column was then washed with 5 column volumes of TBS-AG at the same flow rate. The specifically-bound HP is then eluted from the column with a bolus of excess EE peptide (NH₂-EEEEYMPME-10 COOH; Sigma-Genosys, St. Louis, MO) solubilized in a volume of 15 mL in TBS-AG at 10 mM. The eluant is then applied similarly to the anti-Flag-tag affinity column, similarly washed, and eluted from the column with excess anti-FLAG peptide (NH₂-DYKDDDDK-COOH; Sigma-Genosys, St. Louis, MO). 15 This material is then dialyzed with two exchanges into a 100 fold volume of TBS-AG overnight at 4°C.

Sucrose gradient ultracentrifugation is then used to remove misfolded polypeptide. Briefly, the material is applied to a discontinuous step gradient of 5%-25% sucrose 20 in TBS-AG and centrifuged in a Beckman SW Ti.50 rotor at 100000xg for 4 hours at 4°C. The properly conformed HP, e.g., FlagTag-Human m1 mAChR-EE, material is collected at the 5%-25% interface. This material is then subjected to a final dialysis with two exchanges into a 100 fold volume of 25 TBS-AG overnight at 4°C.

The protein concentration of the HP solution is determined by colorimetric protein assay (Bio-Rad Laboratories, Inc., Hercules, CA) and adjusted as necessary, by dilution or concentration in a stirred ultrafiltration 30 cell (Millipore, Bedford, MA), to 50 μM. The detergent concentration is also determined by RPC-UV using a Higgins C-18 column whereupon 50 μL of the mixture the ligand is eluted into a high-resolution mass spectrometer for analysis using a gradient of 5%-95% acetonitrile (0.1% formic acid 35 counterion) in water (w/ 0.1% formic acid) over 20 minutes.

The *Rt* of the DbM is determined by a separate control experiments under identical conditions. To quantitate the amount of detergent, the area under the DbM peak from the protein sample is compared to a standard curve generated 5 from multiple RPC runs with identical conditions assaying the DbM peak height for DbM samples of known concentration. If the detergent concentration is estimated to be below 0.48 mM (4x cmc), it is adjusted with the addition of a small amount of concentrated DbM in TBS.

10

EXAMPLE 13: EPITOPE AFFINITY AND METAL CHELATE AFFINITY CHROMATOGRAPHY (MCAC) OF HPs

HPs are also constructed with an epitope affinity tag and a metal chelate affinity tag, as represented, for 15 example, by Hemagglutinin SS-Rat m3 mAChR-HSV-OctaHis. Briefly, an isolated nucleic acid molecule encoding Hemagglutinin SS-Rat m3 mAChR-HSV-OctaHis is used in the production of a recombinant baculovirus following methods provided by the manufacturer (Pharmingen, San Diego, CA). 20 Virus production, the large-scale insect cell culture and expression of protein, the preparation of epitope affinity columns, the preparation of solubilized HP, and epitope affinity purification were all performed as previously described herein except that anti-HSV antibody replaces the 25 anti-FLAG antibody in the preparation of the HSV epitope affinity column and the HSV peptide (NH₂-QPELAPEDPED-COOH; Sigma-Genosys) is used to elute the Hemagglutinin SS-Rat m3 mAChR-HSV-OctaHis protein from the column instead of the FLAG peptide. Also, since there is no EE epitope on the 30 Hemagglutinin SS-Rat m3 mAChR-HSV-OctaHis protein, no epitope affinity purification using the EE epitope is used. (Note: The Hemagglutinin SS signal sequence may be cleaved off in some cell lines by cellular proteases in the process of expression and trafficking to the plasma membrane of the

insect cell. From this point on the solubilized protein is referred to as Rat m3 mAChR-HSV-OctaHis.

For the final affinity purification step, Rat m3 mAChR-HSV-OctaHis is applied, at a flow rate of 0.2 mL/minutes, to 5 a MCAC column prepared by loading 10 mL of Ni-NTA resin (Qiagen) into a 1.2 x 15 cm polypropylene column and equilibrating the column with 100 mL of TBS-AG at 4°C at a flow rate of 0.2 mL/minutes. Once the Rat m3 mAChR-HSV-OctaHis is bound to the column, the column is washed with 10 100 mL of TBS-AG containing 5 mM imidazole. Then, the column is developed with a 50 mL linear gradient of 5 mM-350 mM imidazole in TBS-AG at the same flow rate, collecting 0.5 mL fractions. Fractions containing active mAChR, as assessed by a known radioligand binding assay, elute at 15 imidazole concentrations of 190-240 mM in a volume of 11 mL. This material is then dialyzed with three exchanges into a 100 fold volume of TBS-AG overnight at 4°C to remove excess imidazole. The material is then subjected to sucrose gradient ultracentrifugation and the concentrations of 20 protein and detergent are estimated and adjusted as previously described herein.

EXAMPLE 14: CHARACTERIZATION OF PURIFIED HPs

To confirm the purity of the final preparation of the 25 HP(s) produced herein, each sample is subjected to SDS-PAGE analysis on 5-12% Novex (Invitrogen, San Diego, CA) gels according to the manufacturer's instructions. Ten μ g of sample are loaded per gel lane, and the protein samples are visualized by silver staining (Peterson, G.L. et al. (1995) 30 *J. Biol. Chem.* 270: 17808). The specific activities of the mAChR proteins prepared according to these methods are determined according the method of Peterson, G.L. et al. (Peterson, G.L. et al. (1995) *J. Biol. Chem.* 270: 17808). For the methods described herein, typically the specific

activity of the proteins is determined to be in the range of 11-16 nmol of specific ligand binding per mg mAChR protein.

Ligand affinity chromatography is another measure by which the HPs of the invention may be evaluated for specific 5 activity. For example, the mAChR purified by the methods described herein may be subjected to known ligand affinity chromatography over a column of immobilized mAChR ligand 3-(2'-aminobenzhydryloxy)-tropane (ABT) .

EQUIVALENTS

Those skilled in the art will recognize, or be able to ascertain, using no more than routine experimentation, many equivalents to the specific embodiments of the invention
5 described herein. Such equivalents are intended to be encompassed by the following claims.

What is claimed is:

1. A method for identifying a ligand for a hydrophobic protein, the method comprising
 - 5 (a) selecting a ligand molecule by affinity selection by exposing a hydrophobic target protein bound by an amphiphile to a multiplicity of molecules to promote the formation of at least one complex between the hydrophobic target protein and the ligand molecule,
 - 10 (b) separating the complex from the unbound molecules, and
 - (c) identifying the ligand molecule.
- 15 2. The method of claim 1, wherein exposure of the hydrophobic target protein to a multiplicity of molecules occurs under homogeneous solution phase conditions.
- 20 3. The method of claim 1, wherein exposure of the hydrophobic target protein to a multiplicity of molecules occurs under heterogeneous solution phase conditions.
- 25 4. The method of claim 1, wherein selection of the ligand molecule is done using multi-dimensional chromatography.
5. The method of claim 1, wherein the hydrophobic target protein is selected from the group consisting of:
 - 30 (a) of a membrane protein,
 - (b) an integral membrane protein,
 - (c) a transmembrane protein,
 - (d) a monotopic membrane protein,
 - 35 (e) a polytopic membrane protein,
 - (f) a pump protein,
 - (g) a channel protein,

- (h) a receptor kinase protein,
- (i) a G protein-coupled receptor protein,
- (j) a membrane-associated enzyme, and
- (k) a transporter protein.

5

- 6. The method of claim 1, wherein the multiplicity of molecules is a mass-coded library of molecules.
- 7. The method of claim 1, wherein the multiplicity of molecules is a library of molecules that is not mass-coded.
- 8. The method of claim 1, wherein the amphiphile is selected from the group consisting of:
 - 15 (a) a polar lipid,
 - (b) an amphiphilic macromolecular polymer,
 - (c) a surfactant or detergent, and
 - (d) an amphiphilic polypeptide.
- 20 9. The method of claim 1, wherein ligand molecule identification is done by mass spectral analysis.
- 10. The method of claim 1, wherein the ligand molecule is deconvoluted by mass spectral analysis.
- 25 11. The method of claim 1, wherein separation of the complex from the unbound molecules is accomplished with solid phase chromatography media.
- 30 12. The method according to claim 1, wherein the hydrophobic target protein comprises
 - (a) at least one transmembrane domain sequence,
 - (b) at least two tag sequences useful for affinity selection, and
 - 35 (c) a hydrophobic protein (HP) sequence.

13. The method according to claim 12, wherein the hydrophobic protein sequence is selected from the group consisting of

- (a) of a membrane protein,
- 5 (b) an integral membrane protein,
- (c) a transmembrane protein,
- (d) a monotopic membrane protein,
- (e) a polytopic membrane protein,
- (f) a pump protein,
- 10 (g) a channel protein,
- (h) a receptor kinase protein,
- (i) a G protein-coupled receptor protein,
- (j) a membrane-associated enzyme, and
- (k) a transporter protein.

15

14. The method according to claim 12, wherein the tag sequences comprise epitope tag sequences selected from the group consisting of

- (a) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:29),
- 20 (b) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:30),
- (c) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID NO:31),
- (d) a myc tag (NH₂-KHKLEQLRNSGA-COOH) (SEQ ID NO:32), and
- 25 (e) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:33).

15. The method according to claim 12, wherein the hydrophobic target protein comprises a sequence with an amino terminus to carboxy terminus order selected from the group consisting of

- (a) Tag1-Tag2-HP,
- (b) Tag1-HP-Tag2, and
- (c) HP-Tag1-Tag2.

16. The method according to claim 15, wherein the hydrophobic target protein is selected from the group consisting of

5 (a) Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:7),
(b) Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:8),
(c) Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:9),
(d) Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:10), and
10 (e) Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:11).

17. The method according to claim 15, wherein the hydrophobic target protein further comprises a heterologous signal sequence (SS) at the amino terminus.

15

18. The method according to claim 17, wherein the heterologous signal sequence is selected from the group consisting of

20 (a) the Mellitin signal sequence of NH₂-KFLVNVALVFMVVYISYIYA-COOH (SEQ ID NO:12),
(b) the GP signal sequence of NH₂-VRTAVLILLLVRFSEP-COOH (SEQ ID NO:13),
(c) the Hemagglutinin signal sequence of NH₂-KTIIIALSYIFCLVFA-COOH (SEQ ID NO:14),
25 (d) the rhodopsin tag 1 signal sequence of NH₂-MNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID NO:15), and
(e) the rhodopsin tag ID4 signal sequence of NH₂-GKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:16).

30

19. The method according to claim 18, wherein the tag sequences further comprise a hexahistidine sequence (SEQ ID NO:17) and a decahistidine sequence (SEQ ID NO:18).

35

20. The method according to claim 19, wherein the hydrophobic target protein is selected from the group consisting of

5 (a) GP67 SS-Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:19),
(b) Mellitin SS-Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:20),
(c) Hemagglutinin SS-Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:21),
10 (d) Mellitin SS-Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:22), and
(e) Hemagglutinin SS-Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:23).

15 21. A method of isolating a hydrophobic protein, the method comprising

20 (a) purifying the hydrophobic protein by sucrose gradient ultracentrifugation,
(b) purifying the hydrophobic protein by antibody affinity purification, and
(c) purifying the hydrophobic protein by immobilized metal affinity chromatography.

25 22. The method of claim 21, wherein the hydrophobic protein comprises

30 (a) at least one transmembrane domain sequence,
(b) at least two tag sequences useful for affinity selection, and
(c) a hydrophobic protein (HP) sequence.

35 23. The method according to claim 22, wherein the hydrophobic protein sequence is selected from the group consisting of

(a) a membrane protein,
(b) an integral membrane protein,
(c) a transmembrane protein,

- (d) a monotopic membrane protein,
- (e) a polytopic membrane protein,
- (f) a pump protein,
- (g) a channel protein,
- 5 (h) a receptor kinase protein,
- (i) a G protein-coupled receptor protein,
- (j) a membrane-associated enzyme, and
- (k) a transporter protein.

10 24. The method according to claim 22, wherein the tag sequences comprise epitope tag sequences selected from the group consisting of

- (a) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:29),
- (b) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:30),
- 15 (c) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID NO:31),
- (d) a myc tag (NH₂-KHKLEQLRNNSGA-COOH) (SEQ ID NO:32), and
- (e) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:33).

20 25. The method according to claim 22, wherein the hydrophobic protein comprises a sequence with an amino terminus to carboxy terminus order selected from the group consisting of

- (a) Tag1-Tag2-HP,
- (b) Tag1-HP-Tag2, and
- (c) HP-Tag1-Tag2.

25 26. The method according to claim 22, wherein the hydrophobic protein is selected from the group consisting of

- (a) Myc tag-EE tag-Human m2 mAChR (SEQ ID NO:7),
- (b) Flag tag-Human Beta 2 Adrenergic Receptor-EE tag (SEQ ID NO:8),
- 30 (c) Human Neurokinin 3 Receptor-HSV tag-Myc tag (SEQ ID NO:9),

- (d) Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:10), and
- (e) Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:11).

27. The method according to claim 22, wherein the
5 hydrophobic protein further comprises a heterologous
signal sequence (SS) at the amino terminus.

28. The method according to claim 27, wherein the
heterologous signal sequence is selected from the group
10 consisting of

- (a) the Mellitin signal sequence of NH₂-
KFLVNVALVFMVVYISYIYA-COOH (SEQ ID NO:12),
- (b) the GP signal sequence of NH₂-VRTAVLILLLVRFSEP-
COOH (SEQ ID NO:13),
- (c) the Hemagglutinin signal sequence of NH₂-
KTIIIALSYIFCLVFA-COOH (SEQ ID NO:14),
- (d) the rhodopsin tag 1 signal sequence of NH₂-
MNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID
NO:15), and
- (e) the rhodopsin tag ID4 signal sequence of NH₂-
GKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:16).

29. The method according to claim 14, wherein the tag
sequences further comprise a hexahistidine sequence
25 (SEQ ID NO:17) and a decahistidine sequence (SEQ ID
NO:18).

30. The method according to claim 29, wherein the
hydrophobic target protein is selected from the group
30 consisting of

- (a) GP67 SS-Myc tag-EE tag-Human m2 mAChR (SEQ ID
NO:19),
- (b) Mellitin SS-Flag tag-Human Beta 2 Adrenergic
Receptor-EE tag (SEQ ID NO:20),
- (c) Hemagglutinin SS-Human Neurokinin 3 Receptor-HSV
tag-Myc tag (SEQ ID NO:21),

- (d) Mellitin SS-Flag tag-Human m1 mAChR-EE tag (SEQ ID NO:22), and
- (e) Hemagglutinin SS-Rat m3 mAChR-HSV tag-OctaHis tag (SEQ ID NO:23).

5

- 31. An isolated nucleic acid molecule suitable for hydrophobic protein expression, comprising
 - (a) a vector polynucleotide sequence for protein expression in a eukaryotic cell, and
 - (b) a polynucleotide sequence encoding an engineered hydrophobic protein comprising the following elements
 - (i) an N-terminal methionine residue,
 - (ii) a heterologous signal sequence (SS),
 - (iii) at least one transmembrane domain sequence,
 - (iv) at least two tag sequences useful for affinity selection, and
 - (v) a hydrophobic protein (HP) sequence.
- 20 32. The isolated nucleic acid molecule of claim 32, wherein the N-terminal methionine sequence and the heterologous signal sequence are selected from the group consisting of
 - (a) MKFLVNVALVFMVYYISYIYA (SEQ ID NO:24),
 - (b) MVRTAVLILLLVRFSEP (SEQ ID NO:25),
 - (c) MKTIIIALSYIFCLVFA (SEQ ID NO:26)
 - (d) MMNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID NO:27) and
 - (e) MGKNPLGVRKTETSQVAPA-COOH (SEQ ID NO:28).
- 25 33. The isolated nucleic acid molecule of claim 33, wherein the tag sequences comprise epitope tag sequences selected from the group consisting of
 - (a) a FLAG tag (NH₂-DYKDDDDK-COOH) (SEQ ID NO:1),
 - (b) an EE tag (NH₂-EEEEYMPME-COOH) (SEQ ID NO:2),
- 30
- 35

- (c) a hemagglutinin tag (NH₂-YPYDVPDYA-COOH) (SEQ ID NO:3),
- (d) a myc tag (NH₂-KHKLEQLRNSGA-COOH) (SEQ ID NO:4), and
- 5 (e) an HSV tag (NH₂-QPELAPEDPED-COOH) (SEQ ID NO:5).

34. The isolated nucleic acid molecule of claim 33, wherein the elements of the engineered hydrophobic protein are arrayed from an amino to carboxy terminus order selected from the group consisting of

- (a) SS-Tag1-Tag2-HP,
- (b) SS-Tag1-HP-Tag2, and
- (c) SS-HP-Tag1-Tag2.

10 35. The isolated nucleic acid molecule of claim 34, wherein the tag sequences further comprise a hexahistidine sequence (SEQ ID NO:17) and a decahistidine sequence (SEQ ID NO:18).

15 36. The isolated nucleic acid molecule of claim 35, wherein the engineered hydrophobic protein is selected from the group consisting of

- (a) GP67-Myc-EE-Human m2 mAChR (SEQ ID NO:19),
- (b) Mellitin-Flag Tag-Human m1 mAChR-EE (SEQ ID NO:20), and

20 37. A method for identifying a ligand for a hydrophobic protein, the method comprising

- (a) selecting a hydrophobic target protein from the group consisting of
- 25 (i) of a membrane protein,
- (ii) an integral membrane protein,
- (iii) a transmembrane protein,
- (iv) a monotopic membrane protein,
- 30 (v) a polytopic membrane protein,
- (vi) a pump protein,
- (vii) a channel protein,

- (viii) a receptor kinase protein,
- (ix) a G protein-coupled receptor protein,
- (x) a membrane-associated enzyme, and
- (xi) a transporter protein,
- 5 (xii) wherein the hydrophobic protein is bound by amphiphile;
- (b) selecting an amphiphile to bind the hydrophobic protein from the group consisting of:
 - (i) a polar lipid,
 - 10 (ii) an amphiphilic macromolecular polymer,
 - (iii) a surfactant or detergent, and
 - (iv) an amphiphilic polypeptide;
- (c) selecting a ligand molecule using multi-dimensional chromatography by affinity selection by exposing under homogenous solution phase conditions the hydrophobic target protein bound by an amphiphile to a multiplicity of molecules from a mass-coded library to promote the formation of at least one complex between the hydrophobic 15 target protein and the ligand molecule;
- (d) separating the complex from the unbound molecules; and
- (e) identifying the ligand molecule by mass spectral 20 analysis.

25 38. A method for identifying a ligand for a hydrophobic protein, the method comprising

- (a) selecting a hydrophobic target protein from the group consisting of
 - (i) of a membrane protein,
 - (ii) an integral membrane protein,
 - (iii) a transmembrane protein,
 - (iv) a monotopic membrane protein,
 - (v) a polytopic membrane protein,
 - 30 (vi) a pump protein,

- (vii) a channel protein,
- (viii) a receptor kinase protein,
- (ix) a G protein-coupled receptor protein,
- (x) a membrane-associated enzyme, and
- 5 (xi) a transporter protein,
- (xii) wherein the hydrophobic protein is bound by amphiphile;

(b) selecting an amphiphile to bind the hydrophobic protein from the group consisting of:

- 10 (i) a polar lipid,
- (ii) an amphiphilic macromolecular polymer,
- (iii) a surfactant or detergent, and
- (iv) an amphiphilic polypeptide;

(c) selecting a ligand molecule using multi-dimensional chromatography by affinity selection by exposing under heterogeneous solution phase conditions a hydrophobic target protein bound by an amphiphile to a multiplicity of molecules from a library that is not mass-coded to promote the formation of at least one complex between the hydrophobic target protein and the ligand molecule;

20 (d) separating the complex from the unbound molecules, ;and

25 (e) identifying the ligand molecule by mass spectral analysis.

39. A method of isolating a hydrophobic protein, the method comprising

30 (a) selecting a hydrophobic protein comprising

- (i) at least one transmembrane domain sequence,
- (ii) at least two tag sequences useful for affinity selection, selected from the group

35 consisting of:

- (1) a FLAG tag (NH2-DYKDDDDK-COOH) (SEQ ID NO:29),
- (2) an EE tag (NH2-EEEEYMPME-COOH) (SEQ ID NO:30),
- 5 (3) a hemagglutinin tag (NH2-YPYDVPDYA-COOH) (SEQ ID NO:31),
- (4) a myc tag (NH2-KHKLEQLRNSGA-COOH) (SEQ ID NO:32), and
- (5) an HSV tag (NH2-QPELAPEDPED-COOH) (SEQ ID NO:33);
- 10 (iii) a hydrophobic protein (HP) sequence selected from the group consisting of:
 - (1) a membrane protein,
 - (2) an integral membrane protein,
 - 15 (3) a transmembrane protein,
 - (4) a monotopic membrane protein,
 - (5) a polytopic membrane protein,
 - (6) a pump protein,
 - (7) a channel protein,
 - 20 (8) a receptor kinase protein,
 - (9) a G protein-coupled receptor protein,
 - (10) a membrane-associated enzyme, and
 - (11) a transporter protein;
- 25 (b) purifying the hydrophobic protein by sucrose gradient ultracentrifugation;
- (c) purifying the hydrophobic protein by antibody affinity purification; and
- (d) purifying the hydrophobic protein by immobilized metal affinity chromatography.
- 30

40. An isolated nucleic acid molecule suitable for hydrophobic protein expression, comprising

- (a) a vector polynucleotide sequence for protein expression in a eukaryotic cell; and

(b) a polynucleotide sequence encoding an engineered hydrophobic protein comprising the following elements

5 (i) an N-terminal methionine residue,
(ii) a heterologous signal sequence (SS), wherein the N-terminal methionine sequence and the heterologous signal sequence are selected from the group consisting of

10 (1) MKFLVNVALVFMVVYISYIYA (SEQ ID NO:24),
(2) MVRTAVLILLLVRFSEP (SEQ ID NO:25),
(3) MKTIIIALSYIFCLVFA (SEQ ID NO:26)
(4) MMNGTEGPNFYVPFSNKTGVVRSPFEAPQYYLAEP-COOH (SEQ ID NO:27) and
15 (5) MGKNPLGVRKTETTSQVAPA-COOH (SEQ ID NO:28),

15 (iii) at least one transmembrane domain sequence;
(iv) at least two tag sequences useful for affinity selection selected from the group consisting of

20 (1) a FLAG tag (NH2-DYKDDDDK-COOH) (SEQ ID NO:1),
(2) an EE tag (NH2-EEEEYMPME-COOH) (SEQ ID NO:2),
25 (3) a hemagglutinin tag (NH2-YPYDVPDYA-COOH) (SEQ ID NO:3),
(4) a myc tag (NH2-KHKLEQLRNSGA-COOH) (SEQ ID NO:4), and
30 (5) an HSV tag (NH2-QPELAPEDPED-COOH) (SEQ ID NO:5), and

35 (v) a hydrophobic protein (HP) sequence selected from the group consisting of:
(1) a membrane protein,
(2) an integral membrane protein,

- (3) a transmembrane protein,
- (4) a monotopic membrane protein,
- (5) a polytopic membrane protein,
- (6) a pump protein,
- 5 (7) a channel protein,
- (8) a receptor kinase protein,
- (9) a G protein-coupled receptor protein,
- (10) a membrane-associated enzyme, and
- 10 (11) a transporter protein.

(54) Title: AFFINITY SELECTION-BASED SCREENING OF HYDROPHOBIC PROTEINS

WO 02/057792 A3

(57) Abstract: The invention relates to methods based on affinity selection for the identification of ligands for hydrophobic proteins bound by amphiphile. The invention also provides hydrophobic proteins and methods of isolation of hydrophobic proteins that are suitable for ligand screening.

INTERNATIONAL SEARCH REPORT

International Application No

PCT/US 01/50088

A. CLASSIFICATION OF SUBJECT MATTER
 IPC 7 G01N33/68 G01N33/53 C12N15/00 G01N33/566 C07K1/22

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHEDMinimum documentation searched (classification system followed by classification symbols)
 IPC 7 G01N C07K C12N

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ, BIOSIS, EMBASE, MEDLINE

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

 Further documents are listed in the continuation of box C. Patent family members are listed in annex.

° Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance
 "E" earlier document but published on or after the international filing date
 "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
 "O" document referring to an oral disclosure, use, exhibition or other means
 "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
 "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
 "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
 "&" document member of the same patent family

INTERNATIONAL SEARCH REPORTInternational application No.
PCT/US 01/50088**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

2. Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210

3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

1-20, 29, 30, 37 and 38**Remark on Protest**

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: -

Present claims 1-20, 29, 30, 37 and 38 relate to an extremely large number of possible methods. Support within the meaning of Article 6 PCT and disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the methods claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the following methods: affinity selection of ligands of membrane proteins by screening libraries, separation of solution-phase complex by chromatography and identification of ligand by mass-spectroscopy as described in the examples

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guideline C-VI, 8.5), should the problems which led to the Article 17(2) declaration be overcome.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-20, 29, 30, 37 and 38

Method for identifying a ligand for a hydrophobic protein comprising the use of an amphiphile

2. claims: 21-28 and 39

Method for isolating a hydrophobic protein comprising sucrose gradient ultracentrifuation, antibody affinity purification and immobilized metal affinity chromatography

3. claims: 31-36 and 40

Nucleic acids suitable for hydrophobic protein expression
